# CineConnect

## Full App Audit and Growth Recommendations

Generated: 2026-07-27 - Workspace: /Users/abdulbasit/Desktop/filmapp - Branch: refactor/theme-system - Latest commit inspected: 2efcc58

| Audit area            | Current finding                                                                                                                         |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Overall product state | Strong demo-ready multi-portal product with live backend foundations and production web deployment.                                     |
| Main blocker          | Business/provider production inputs: payment gateway, bank details, SMS/OTP, email, Firebase push, legal policies, monitoring, backups. |
| Technical risk        | One Flutter widget test currently fails for Actor/Talent mobile More menu; backend integration tests require MySQL/Redis mode to run.   |
| Best next move        | Finish live walkthrough, fix the actor mobile menu test, then replace dummy providers with real credentials.                            |

# 1. Executive summary

- Backend/API/database foundation is broad and mature: 18 backend API modules, 28 migrations, 187 documented OpenAPI paths, and 233 operations.
- Flutter app is large and multi-portal: 389 Dart files, 14 feature areas, and more than 115 portal/screen files under lib/features.
- Production web is already deployed on <https://cine.nalexustechologies.com> and configured to use <https://cine.nalexustechologies.com/api/v1>.
- Runtime static feature demo data has mostly been removed from lib/features according to the portal audit docs. Remaining demo content should live in MySQL/storage seed rows, not hardcoded UI lists.
- The app is excellent for investor/demo walkthrough after final visual QA, but not yet ready for real-money public production until external providers and legal policies are finalized.

| Signal               | Result                                                                                                           |
|----------------------|------------------------------------------------------------------------------------------------------------------|
| flutter analyze      | Pass - no issues found                                                                                           |
| flutter test         | 631 total observed; 630 passed, 1 failed in actor_talent_portal_test because finder could not locate text "More" |
| Backend pytest       | 16 passed, 40 skipped because integration tests require RUN_INTEGRATION_TESTS=1 with MySQL and Redis             |
| OpenAPI coverage     | 187 paths / 233 operations in docs/openapi.yaml                                                                  |
| Latest pushed commit | 2efcc58 Hide public portal KYC messaging                                                                         |

## 2. What is complete now

Complete here means complete for the current demo/live-backed scope, not final commercial launch. The strongest parts are the backend foundation, shared workflows, and major marketplace/booking flows.

| Area                         | Status                             | Evidence                                                                                                                                                                                      |
|------------------------------|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Backend platform             | Mostly complete                    | Auth, roles, KYC, files, marketplace, projects, bookings, contracts, payments, operations, specialist portals, trust/safety, analytics, admin modules exist.                                  |
| Database                     | Mostly complete                    | 28 migrations; production migration history documented through core phases and later influencer/general-public additions.                                                                     |
| Frontend shell and UI system | Complete for demo                  | Consistent portal shells, responsive side/bottom navigation, dark/light theme, route-level widget tests.                                                                                      |
| Director/Producer            | Live/mostly clean                  | Projects, marketplace, shortlist, booking request, bargaining, contracts, payments, schedule, room, reports.                                                                                  |
| Actor/Talent                 | Live/cleaned                       | Profile, portfolio, availability, opportunities, auditions/applications, bookings, contracts, earnings, reviews, safety.                                                                      |
| Marketplace                  | Live with expanded categories      | Actors, models, influencers, locations, media/equipment, agencies, and related discovery DTOs/listings.                                                                                       |
| General Public portal        | New dedicated portal               | Public customer role can browse and request actors/models/influencers without KYC prompts in UI.                                                                                              |
| Influencer role              | New role plus marketplace category | Influencer demo data and image-backed listings seeded; profile/category concept added.                                                                                                        |
| Deployment                   | Live web/API domain                | Flutter web deployed at <a href="https://cine.nalexustechologies.com">cine.nalexustechologies.com</a> ; API base points at <a href="https://cine.nalexustechologies.com/api/v1">/api/v1</a> . |
| Demo data                    | Good demo base                     | Seed scripts and PDF login handoffs exist; demo data is intended to be backend/database backed.                                                                                               |

### 3. Portal-by-portal audit matrix

This matrix combines the current route inventory, existing audit docs, and code structure. The key distinction is whether a portal is live-backed, gap-backed, or waiting for final manual walkthrough.

| Portal               | Main routes/screens                                                                                                                                                 | Status                        | Missing or watch item                                                                                                 |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Director / Producer  | 19 screens: dashboard, projects, create wizard, project detail, marketplace, shortlist, booking, bargaining, contracts, payments, schedule, accounts, room, reports | Strong / live-backed          | Manual walkthrough and edge-case validation; keep stable while other roles mature.                                    |
| Actor / Talent       | 17 screens including profile, portfolio, availability, rates, opportunities, auditions, applications, bookings, contracts, earnings, safety                         | Strong / live-backed          | Fix current mobile More test; real OTP/push/email still provider-dependent.                                           |
| Model Extension      | 8 screens: categories, rights, portfolio, rates, brand safety, profile, opportunities                                                                               | Live/cleaned                  | Needs rich backend rate-card/category depth if product wants advanced model commercial rights.                        |
| Influencer           | Implemented through role/category and marketplace/public booking flows                                                                                              | New / partial portal identity | A fully separate influencer portal can be expanded with social metrics, rate packages, campaign analytics, media kit. |
| General Public       | Routes: home, browse, actors, models, influencers, profile, booking request, requests, contracts, payments, account                                                 | New / dedicated portal        | Needs full manual login walkthrough; public customer booking conversion flow should be UX-tested.                     |
| Location Owner       | 14 screens: listing, availability, pricing, rules, requests, inspections, earnings, performance, portfolio, opportunities                                           | Live/cleaned                  | Availability and inspection workflows need real seeded/live IDs for full mutation validation.                         |
| Media / Equipment    | 13 screens: profile, inventory, packages, availability, terms, requests, handover, return, earnings, portfolio, opportunities                                       | Live/cleaned                  | Availability, handover/return workflows need end-to-end live booking/device/session validation.                       |
| Crew Services        | 9 screens: dashboard, profile, portfolio, availability, requests, contracts/payments, ratings, opportunities                                                        | Gap/cleaned                   | Dedicated crew backend data model/API is still the largest portal gap.                                                |
| Casting Agency       | 9 screens: dashboard, roster, auditions, shortlist, self-tapes, notes, commission, records                                                                          | Live/cleaned                  | Need real audition/candidate/self-tape walkthrough with seeded IDs; good candidate for premium feature polish.        |
| Brand Sponsor        | 8 screens: dashboard, profile, opportunity composer, applications, negotiation, tracker, payments                                                                   | Live/cleaned                  | Real payment provider and campaign deliverable proof workflow needed for production.                                  |
| Legal Partner        | 6 screens: dashboard, contract review, template review, addendum review, history/billing                                                                            | Live with gap notes           | Template decision/change-log and legal billing rollups need backend completion.                                       |
| Insurance Partner    | 6 screens: dashboard, records, claims, safety/permits, incidents                                                                                                    | Live with gap notes           | Safety/incident list/detail/update APIs are still needed beyond create-only operations.                               |
| Distribution Partner | 5 screens: dashboard, contacts, release coordination, reports                                                                                                       | Live/cleaned                  | Statement export needs backend export endpoint if it should be real.                                                  |
| Super Admin          | Admin dashboard, review hub, KYC, moderation, bookings, payments, contracts, fees, disputes, users, roles, support, broadcasts, audit, analytics                    | Strong / live-backed          | Admin action smoke tests and staff permission assignment still required.                                              |
| Generic Role Portals | Legacy compatibility shell                                                                                                                                          | Gap/cleaned                   | Keep disabled or remove if dedicated portals fully replace it.                                                        |

## 4. What is missing or not fully production-ready

These are the items I would not ignore before calling the app real production. They are not all coding tasks; many require business decisions and external accounts.

| Category                        | Gap                                                                                 | Why it matters                                                              | Recommended priority    |
|---------------------------------|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------|-------------------------|
| OTP/SMS                         | Signup OTP appears simulated/provider-placeholder until SMS provider is configured  | Without real OTP, account verification is show-piece or incomplete          | P0 before public launch |
| Email                           | Transactional email provider and templates need real credentials                    | Password reset, notifications, contracts, invoices need reliable delivery   | P0                      |
| Payments                        | Manual bank/card flows are sandbox/dummy                                            | Real money cannot launch without gateway, webhooks, reconciliation, refunds | P0                      |
| Bank transfer                   | Bank details and proof review SOP pending                                           | Manual payments need exact account/reference/SLA process                    | P0                      |
| Firebase push                   | Backend push devices exist but Firebase credentials/config are pending              | Mobile notifications will not be real without FCM/APNs setup                | P1                      |
| Monitoring                      | Sentry wiring placeholder exists but final DSN/alerts pending                       | You need crash/error visibility after launch                                | P1                      |
| Backups                         | Local/production backup scripts exist; off-server destination/restore drill pending | A database without restore-tested backups is a business risk                | P0/P1                   |
| Legal/policy                    | Terms, privacy, retention, refund, dispute, KYC wording need approval               | Marketplace liability and KYC/payment retention need real policy            | P0                      |
| Crew Services                   | Dedicated crew APIs/data model missing                                              | The portal is clean but cannot be fully alive without backend shape         | P1                      |
| Insurance safety/incidents      | List/detail/update APIs missing for some screens                                    | Create-only endpoints cannot power a review/operations console              | P1                      |
| Legal partner billing/templates | Decision history and billing rollups incomplete                                     | Legal portal feels less operational without these workflows                 | P2                      |
| Manual QA                       | Full human authenticated walkthrough still needed                                   | Headless/screens tests do not prove real user UX acceptance                 | P0                      |

## 5. Test and quality findings from this audit

| Check                       | Result                                        | Interpretation                                                                                                                                 |
|-----------------------------|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Dart analyzer               | Pass                                          | No static Dart analyzer issues in current workspace.                                                                                           |
| Flutter widget suite        | One failure                                   | The actor/talent mobile More-menu test cannot find text "More". Likely a UI label/icon/responsive behavior mismatch or test expectation drift. |
| Backend tests               | 16 passed, 40 skipped                         | Unit-level suite passes; integration tests require RUN_INTEGRATION_TESTS=1 with MySQL and Redis.                                               |
| Static demo data scan       | Docs report cleaned feature-level demo stores | Continue to enforce database-seeded demo data only for visible portal records.                                                                 |
| Production deployment state | Recent frontend deployed and pushed           | Last known live domain works; this audit did not redeploy because no app code was requested/changed.                                           |

### Immediate QA fixes:

- Fix or update test/actor\_talent\_portal\_test.dart mobile More expectation, then rerun full flutter test.
- Run backend integration tests with MySQL/Redis enabled, not only skipped mode.
- Do a login-based manual walkthrough for every demo account and record pass/fail screenshots.
- Add at least one Playwright or browser automation flow for signup, login, marketplace search, booking request, payment proof, and admin review.

## 6. What requires your input

| Input needed from you | Decision or artifact required                                                                                   |
|-----------------------|-----------------------------------------------------------------------------------------------------------------|
| Bank transfer details | Bank name, account title, IBAN/account number, branch/SWIFT if any, payment reference format, proof review SLA. |
| Payment gateway       | Provider choice, live/test keys, webhook secret, fees, refund and chargeback policy.                            |
| SMS/OTP provider      | Provider account, API key, sender ID, approved message templates, countries and spending limits.                |
| Email provider        | Domain/sender, API/SMTP credentials, SPF/DKIM/DMARC, support/reply-to mailbox.                                  |
| Firebase push         | Firebase project, web/mobile app IDs, service account, APNs/FCM settings.                                       |
| Object storage/CDN    | Keep local disk or choose S3/R2/etc.; provide bucket names, keys, retention rules, CDN domain.                  |
| Monitoring/alerts     | Sentry DSN or alternative, alert recipients, severity rules.                                                    |
| Backup destination    | Off-server backup location, retention policy, restore test schedule.                                            |
| Legal docs            | Terms, privacy, KYC consent, contract templates, cancellation/refund/dispute policy, safety policy.             |
| Operational people    | Admin, finance reviewer, KYC reviewer, support, legal reviewer, escalation contacts.                            |
| Release decision      | Demo-only, private beta, or public launch. This changes how strict payments/KYC/legal must be.                  |

## 7. Suggested features to make CineConnect more interesting

These are not random add-ons; they build on what CineConnect already has: roles, marketplace, projects, bookings, contracts, payments, and trust/safety.

| Feature idea                      | What it adds                                                                                                                         | Why it is valuable                                                    |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|
| AI casting match score            | Directors upload script/role brief; app ranks actors/models/influencers by fit, city, availability, budget, language, and risk flags | Makes discovery feel magical and saves production teams hours.        |
| Campaign package builder          | Influencers/models create packages: reel, story, shoot day, usage period, exclusivity, deliverables                                  | Turns profiles into buyable products for general public and brands.   |
| Self-tape audition room           | Director/agency sends audition brief; talent uploads self-tape; team scores and comments                                             | Huge film-industry relevance and demo wow factor.                     |
| Smart availability matching       | When booking, show only people/locations/equipment available for shoot dates                                                         | Reduces failed requests and negotiation friction.                     |
| Escrow-style payment timeline     | Milestones: booking lock, shoot day, deliverable approval, payout release                                                            | Builds trust for both producers and providers.                        |
| Verified media kit                | Talent/influencer public page with reels, metrics, audience demographics, rate cards, reviews                                        | Makes the marketplace feel premium and commercially credible.         |
| In-app contract wizard            | Simple contract generation with variable clauses for shoot type, usage rights, cancellation, overtime                                | Differentiates from generic booking apps.                             |
| Production moodboard/project room | Share references, location images, script files, pinned decisions, approvals                                                         | You already have project room foundations; make it visually strong.   |
| Crew/equipment bundles            | Create packages like "Music video night shoot kit" with crew + camera + lights + location                                            | High-value marketplace behavior and easier purchasing.                |
| Reputation and safety score       | Transparent trust score based on reviews, dispute history, KYC, response time, completion rate                                       | Makes a marketplace safer and more game-like.                         |
| AI assistant inside each portal   | Role-specific assistant: director planner, talent profile coach, brand campaign helper, admin triage                                 | Memorable feature that makes every portal feel alive.                 |
| Public campaign wizard            | General public enters brand, city, budget, deliverables; app recommends actors/models/influencers                                    | This will make the new customer portal easier for non-industry users. |

## 8. Recommended next implementation roadmap

| Order | Milestone                 | Concrete tasks                                                                                           | Done when                                                          |
|-------|---------------------------|----------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------|
| 1     | Stabilize QA              | Fix Actor/Talent mobile More test; rerun flutter test; run backend integration tests with MySQL/Redis    | All tests pass or documented with accepted exceptions.             |
| 2     | Manual walkthrough        | Use demo logins for every portal; test create/read/update flows and screenshots                          | Each portal has pass/fail notes and no surprise validation errors. |
| 3     | Provider activation       | Configure SMS, email, Firebase, monitoring, backup destination                                           | OTP/email/push/errors/backups work with real providers.            |
| 4     | Payment productionization | Add real bank/gateway details, webhooks, refund/chargeback handling                                      | Manual and card payments are real and auditable.                   |
| 5     | Close backend gaps        | Crew APIs; insurance incident list/detail/update; legal billing/template decisions; distribution exports | Gap screens show live data and real actions.                       |
| 6     | Premium marketplace       | AI match scoring, media kits, packages, self-tape auditions, smart availability                          | Demo becomes more than CRUD; it becomes compelling.                |
| 7     | Launch hardening          | Rate limits, logs, alerts, backups restore drill, accessibility, device QA, store signing                | Ready for private beta or public release.                          |

## 9. Audit sources inspected

- Docs: IMPLEMENTATION\_PROGRESS.md, CINECONNECT\_PORTAL\_API\_AUDIT.md, CINECONNECT\_CURRENT\_STATUS\_AND\_NEXT\_STEPS\_REPORT.md, CINECONNECT\_COMPLETE\_STATUS\_WALKTHROUGH\_REPORT.md, M10\_UI\_ACTION\_AUDIT.md, INFLUENCER\_GENERAL\_PUBLIC\_ROLE\_IMPLEMENTATION\_PLAN.md.

- Code: lib/features route and screen inventory, backend/app/api modules, docs/openapi.yaml, backend migrations, test suite files.

- Commands run: git status/log, flutter analyze, flutter test, backend pytest, route/API counting scripts, static demo/gap string scan.

Bottom line: CineConnect is already an impressively broad live-backed marketplace prototype. The fastest path to a sharper demo is QA polish plus a few premium marketplace features. The fastest path to real production is provider/legal/payment hardening.
