

CINECONNECT

Complete AI UI/UX & Functional Build Specification

12 Portals • Shared Core • 131 Screens • Mobile + Web

Premium cinematic holographic design system
Compact light and dark themes
Static demo architecture with fully working interactions

Prepared for direct integration into AI coding workflows

NALexus Technologies | July 2026

Document Purpose

Primary outcome: A build-ready instruction set that an AI coding agent can use to generate the complete application shell, reusable components, seeded demo data and every portal screen without inventing a new visual language.

Source of truth: The existing Super Admin Dashboard theme is authoritative. This document extends its design tokens, density, glass treatment, typography, navigation rhythm and interaction language across the whole product; it must not redesign the dashboard from scratch.

Meaning of “static but working”: No production backend is required for the first build, but the application must behave like a real product. Routes, forms, filters, tabs, drawers, calendars, uploads, validations, status changes, local notifications, theme switching and role switching must work with shared seeded data and persistent local state.

Non-negotiable: No screen may contain a dead button, unexplained placeholder, generic lorem ipsum, disconnected duplicate data, uncontrolled overflow, or a visual pattern inconsistent with the shared design system.

Executive Build Mandate

- Build one coherent product, not 12 unrelated templates. The portals are role-specific views over the same marketplace, booking, contract, payment and trust engines.
- Use one Flutter mobile application with role-based shells. Use a responsive web shell for Director/Producer and partner portals, and a separate security-hardened web shell for Super Admin.
- Implement the full navigation and interaction graph with local repositories and state machines first. A later backend must be able to replace repositories without rewriting UI components.
- Optimize for compact, premium information density. Avoid giant cards, excessive vertical whitespace, thick borders, oversized headings and decorative dashboards that hide work.
- Apply cinematic holographic styling through subtle layered gradients, controlled glows, translucent command surfaces, depth, motion and high-quality media treatment—not through constant neon effects.
- Every screen must support dark and light themes, responsive widths, loading, empty, error, partial-data, permission-restricted and success states.

1. Product Architecture & Shared Engines

Architecture sentence: Every portal is a different face on five shared engines: Marketplace, Booking/Bargain, Contract, Payment Verification, and Trust/Dispute. New roles should reuse these engines instead of introducing parallel logic.

Engine	Build responsibility
Marketplace Engine	Profiles, portfolios, listings, inventories, requirements, discovery, filters, availability and shortlists. One searchable index serves every demand-side view.
Booking / Bargain Engine	Structured offers, counteroffers, expiry, terms locking, shared negotiation history, cancellation and the central booking state machine.
Contract Engine	Admin-controlled templates, placeholder validation, document generation, version history, correction requests, signatures, addendums, QR identity and vault records.
Payment Verification Engine	Milestone schedules, proof upload, mismatch checks, admin verification, immutable receipts, ledgers, refunds, deposits and agency/platform splits.
Trust / Dispute Engine	KYC/KYB, moderation, masking, reports, inspections, handovers, claims, ratings, audit logs and the evidence room used for resolution.

Shared-object rule

- One booking object, rendered differently for each party. Never create one director-side booking and another actor-side booking.
- One negotiation timeline, with role-aware actions. Every round is immutable after submission.
- One contract record with versions and signature events. The viewer may vary, but the underlying document identity is shared.
- One ledger. Dashboards and payment centers are filtered views, not separate totals.
- One evidence graph. Chat, proof, inspection, claim and audit events retain their source links.

Repository boundaries for the static build

Required repositories: auth, roles, users, profiles, projects, requirements, marketplace, bookings, negotiations, contracts, payments, ledgers, calendars, chats, notifications, disputes, moderation, analytics and settings.

Required behavior: Each repository exposes typed read methods, intent-based mutation methods and observable state. Widgets may not directly change status strings. All demo mutations pass through services so production APIs can later replace local storage.

Persistence: Use local database or structured local storage for theme, active role, onboarding completion, filters, drafts and demo mutations. Include "Reset Demo Data" in developer settings.

2. Booking Lifecycle & Cross-Portal Rules

DRAFT → SENT → UNDER NEGOTIATION → TERMS APPROVED → CONTRACT PENDING SIGNATURE → PAYMENT PENDING → PAYMENT UNDER VERIFICATION → SECURED BOOKING → IN PROGRESS → COMPLETION REVIEW → CLOSED

Exceptions from an active state: ↘ DISPUTED ↘ CANCELLED

Draft → Sent: Director/Producer submits a structured request. The stakeholder receives a deep-linked opportunity notification.

Sent → Under Negotiation: The recipient asks, counters or responds. Both portals render the same round history and expiry.

Under Negotiation → Terms Approved: Both sides accept the same final terms. Fields lock and contract generation becomes available.

Terms Approved → Contract Pending Signature: A valid template renders. Missing mandatory fields block generation.

Contract Pending Signature → Payment Pending: All required parties sign. The first due milestone activates.

Payment Pending → Under Verification: Payer uploads proof. Admin receives the proof and exact contract schedule together.

Under Verification → Secured Booking: Admin verifies. Receipts and ledger entries are generated; calendars block dates and operational rooms unlock.

Secured → In Progress → Completion Review: Shoot/service proceeds, category-specific inspections or handovers occur, and both sides confirm completion.

Completion Review → Closed: Final milestone and receipt confirmation complete. Ratings become available.

Any active state → Disputed / Cancelled: Server/state-machine rules determine allowed actions, evidence collection, financial consequence and notifications.

Four questions every screen must answer

- What shared data does the screen read?
- What role-valid intent does it write?

- Which lifecycle state can the action request or affect?
- Who receives a deep-linked notification or audit event?

3. Master Visual Design System

Visual direction: Premium cinematic holographic. The product should feel like a serious production operating system with film-industry atmosphere: deep layered surfaces, polished media, subtle light dispersion, controlled glass, elegant motion and precise compact typography.

Source theme rule: Inspect and reuse the existing Super Admin Dashboard design system before generating any portal. Existing color values, radii, glass blur, typography and navigation geometry override fallback values below.

3.1 Theme Token Contract

Token	Fallback intent	Usage
app.background	Dark: near-black blue / Light: cool off-white	Main canvas; never pure black or stark white.
surface.primary	Near-opaque elevated surface	Tables, forms and high-readability cards.
surface.glass	Translucent surface + blur + 1 px inner highlight	Navigation, command bars, selected overlays; not every card.
accent.gold	Primary action and premium identity	Use for CTA, current selection and key totals.
accent.cyan	Informational/holographic companion	Use for links, live state and secondary data emphasis.
accent.violet	Rare tertiary depth accent	Use sparingly for AI, media and special insight states.
text.primary	High contrast neutral	Main labels and values.
text.secondary	Muted neutral	Metadata, helper text and secondary labels.
state.success/warning/error/info	Semantic tokens	Always override decorative color for operational meaning.
border.subtle	Low-contrast 1 px boundary	Use only when depth/shadow is insufficient.
focus.ring	2 px accessible focus treatment	Visible in both themes and keyboard navigation.

3.2 Light and Dark Theme Rules

- Dark mode is the cinematic flagship, but text-heavy surfaces remain near-opaque for readability. Do not place long tables directly on transparent backgrounds.
- Light mode is designed, not inverted. Use cool neutral canvases, white/soft-grey surfaces, darker gold for text/icons when needed, and restrained shadows instead of black glow.
- Glass blur must have a solid fallback and sufficient contrast. Never rely on transparency to separate information.
- Images and video thumbnails receive consistent overlays, gradients and badges in both themes; do not change crop or information placement across themes.
- Theme switching is instantaneous, animated subtly, available from the global shell, and persisted across restart.

3.3 Typography and Density

- Use the font family already established in Admin Dashboard; otherwise use Inter. Enable tabular figures for money, dates, IDs and analytics.
- Desktop: page title 22–26 px, section title 15–18 px, card title 12–14 px, body 12–13 px, metadata 10–11 px. Mobile: title 20–22 px, body 12–14 px, metadata 10–11 px.
- Compact does not mean unreadable. Maintain minimum 44 px touch targets while reducing unused card padding, heading gaps and decorative blank space.
- Use sentence case. Keep labels concise. Put explanation in tooltips, helper lines or expandable details rather than large subtitles under every heading.
- Use a 4 px base spacing scale: 4, 8, 12, 16, 20, 24, 32. Most card padding should be 12–16 px; dense table rows 40–48 px.

3.4 Surface, Shape and Holographic Treatment

- Radii: 10–14 px for controls/cards, 16–20 px for major panels, pill only for status and compact filters. Do not make every rectangle a large rounded capsule.
- Use one or two soft directional glows per screen. Glows should guide attention, not outline every component.
- Glass surfaces use translucent fill, backdrop blur, thin inner highlight and soft shadow. Tables, contract text and financial records use more opaque surfaces.

- Add subtle film-grain/noise at very low opacity only to large background areas. Never reduce text clarity.
- Use hairline dividers, layered depth and hover elevation rather than thick borders.
- Cards must have purpose. Avoid nesting cards inside cards unless the inner element is independently interactive.

3.5 Reusable Components

AppShell: Desktop side rail, mobile bottom bar, top command bar, role switcher, theme toggle, notifications and responsive content container.

PageHeader: Breadcrumb/context, concise title, status, primary/secondary actions and optional filter summary.

GlassCommandBar: Search, filters, saved view, sort, date range and view toggle.

MetricCard: Compact value, label, delta, sparkline/indicator and drill-down action.

EntityCard: Image/avatar, title, metadata, trust badges, availability, price/rate and role-aware actions.

DenseDataTable: Sticky header, sort, filter, row selection, status, inline actions and detail drawer.

StatusChip: Tokenized semantic status with icon and accessible text.

Timeline: Negotiation, booking, payment, audit, incident and contract events from a shared pattern.

MediaGrid: Aspect-ratio-safe gallery, moderation status, reorder, preview and watermark states.

WizardScaffold: Stepper, validation, draft persistence, responsive preview and sticky action bar.

EvidenceUploader: Image/PDF/audio preview, metadata, required state, retry and remove.

Empty/Loading/Error: Skeleton, compact empty state, inline retry and route-safe fallback.

ConfirmSheet: Review summary, risk warning, final intent and success/failure feedback.

DetailDrawer: Desktop context-preserving record view; equivalent mobile bottom sheet/full route.

HolographicChartFrame: Accessible chart container with filter, legend, tooltip and summary.

4. Responsive Layout, Navigation & Interaction

Desktop grid: 12 columns, compact 16–20 px gutters, maximum readable content width with full-width operational exceptions for tables, evidence rooms and calendars. Side navigation may collapse without losing icon labels through tooltips.

Tablet: Two-column layouts collapse to 8/4 or 5/3 patterns. Detail rails become drawers. Tables progressively hide nonessential columns and preserve status/action fields.

Mobile: One-column content, five-item maximum bottom navigation, horizontal chips for secondary sections, sticky bottom primary action where appropriate, and sheets for filters/context. No horizontal overflow except intentional carousels and tables with frozen identity columns.

Interaction standards

- Hover: slight lift or inner highlight. Press: scale 0.98 or surface compression. Focus: visible focus ring. Selected: semantic/accent outline plus subtle fill.
- Micro-motion duration generally 140–220 ms; larger route transitions 240–360 ms. Respect reduced-motion preferences.
- Use skeleton loading that matches final geometry. Do not use indefinite spinners for whole pages when content structure is known.
- Optimistic local changes are acceptable only when reversible and low risk. Contracts, money, verification and disputes require explicit processing and confirmation states.
- Toasts are for acknowledgement; critical results remain visible in the screen state or timeline.
- Every modal, drawer and sheet is keyboard dismissible, focus-trapped and returns focus to its trigger.

Navigation rules

- Deep links must open the exact project, booking, contract, payment, dispute or notification context.
- Back navigation returns to the previous filter/sort/scroll state, not a reset list.
- Project-scoped Director screens preserve active project context in the header and route.
- Role switching remounts the shell but preserves the signed-in identity and global notifications.
- Unauthorized routes show a permission state and safe return action; they must not leak hidden data.
- Use breadcrumbs only on web where hierarchy is deeper than one level; mobile uses concise back labels and context chips.

Accessibility and localization

- Meet WCAG AA contrast, keyboard navigation, semantic labels, logical focus order, 44 px touch targets and text scaling without clipping.
- Do not communicate status with color alone; combine icon, text and position.
- Prepare strings for English, Urdu and Roman Urdu. Layout must tolerate 30–40% text expansion and right-to-left mode where applicable.
- Dates show timezone; money shows currency; phone/address masking has explanatory accessible text.
- Charts include textual summaries and tables. Media controls include captions/labels where content permits.

5. Static Demo Data & State Architecture

Goal: The demo should feel production-complete while using local data. A reviewer must be able to complete the main marketplace journey without a backend, and the same action must update every affected screen.

5.1 Seed Data Requirements

- At least 3 users per major role with varied verification, ratings, cities, rates and availability.
- At least 4 projects across film, drama, TVC and fashion/brand work, each with requirements and team members.
- Bookings distributed across all major states: draft, negotiation, signature, payment pending, secured, in progress, closed, disputed and cancelled.
- Negotiation histories with 2–4 structured rounds, realistic deadlines and pinned decisions.
- Contracts with unsigned, partially signed, fully signed, correction-requested and addendum states.
- Payments showing pending proof, under verification, verified, rejected, partial, refund and dispute examples.
- Location and equipment inspections with matched and damaged outcomes.
- Notifications, support tickets, moderation items, audit events, ratings and analytics derived from the same seed graph.

5.2 Required Demo Services

AuthDemoService: Login, OTP simulation, role state, verification route and session restore.

BookingStateMachine: Valid transition checks, role permissions, timeline event creation and derived badges.

NegotiationService: Round creation, expiry, acceptance locking and synchronized counterparty views.

ContractDemoService: Template validation, generation, correction, signatures, addendum and vault status.

PaymentDemoService: Milestones, proof preview, verification simulation, ledger/receipt generation and refunds.

NotificationService: Deep-linked action events and read/unread state.

FilePreviewService: Local image/PDF/audio metadata, thumbnails and simulated upload states.

SearchFilterService: Stable sorting, multi-filter logic, saved views and result counts.

ThemeSettingsService: Light/dark/system mode, density and persistence.

DemoResetService: Restore canonical seed data for presentations and automated UI tests.

5.3 No-Dead-Control Rule

For every control: Define a route, local mutation, filter operation, preview, disclosure, acknowledgement or intentionally disabled state with an explanation. Never place a decorative button merely to make the screen appear complete.

For every form: Provide defaults, validation, error copy, draft behavior, submit behavior, success feedback and the exact entity/timeline update.

For every table/card: Provide tap/click behavior, hover/focus behavior, status source, responsive representation and filtered-empty state.

6. Global AI Coding Prompts & Acceptance Gates

MASTER AI SYSTEM PROMPT

You are building CineConnect, a secure film-industry marketplace and production-management application. Treat the existing Super Admin Dashboard theme and reusable components as the immutable visual source of truth. Generate one coherent responsive design system used by all portals. The style is premium cinematic holographic: compact, dark-first but fully designed in light mode, subtle glass, controlled gold/cyan/violet highlights, high readability and no oversized empty cards. Build a fully interactive static demo using typed seeded repositories and persistent local state. Every button, tab, filter, form, upload, drawer, menu, calendar event and status action must work. Use one shared booking state machine and shared objects for negotiations, contracts, payments, chats, notifications, trust and disputes; never duplicate director-side and stakeholder-side data. Support desktop, tablet and mobile layouts, keyboard/touch accessibility, English/Urdu/Roman Urdu-ready strings, loading/empty/error/permission states, and realistic data. Implement screens in the order and contracts described in this specification. Do not invent alternate navigation, change screen IDs or replace operational density with generic marketing UI.

Per-screen coding sequence

1. Read the screen contract and identify shared entities, role permissions, routes and state transitions.
2. Reuse the established shell and component primitives before creating any new component.
3. Build dark and light variants from tokens, not duplicated hard-coded colors.
4. Implement seeded states and all interactions, then verify changes propagate to connected screens.
5. Add responsive behavior, accessibility semantics and empty/loading/error/permission variants.
6. Run visual and interaction acceptance checks; fix overflow, dead actions and inconsistent spacing before proceeding.

Global acceptance checklist

- Existing Admin Dashboard visual language is preserved and extended—not overwritten.
- No overflow at 360 px mobile width, tablet widths or desktop widths; text scaling does not clip.
- Light and dark themes are complete, not partially themed.

- Every primary and secondary action is functional or explicitly disabled with a reason.
- Back/deep-link navigation preserves context.
- Shared object changes propagate across roles and admin screens.
- Loading, empty, error, validation, success and permission states exist.
- Amounts, statuses, IDs, dates and counterparties are unambiguous.
- No generic lorem ipsum, fake repeated names or identical placeholder cards.
- Visual accents are restrained; data readability wins over decoration.

7. Shared Core Layer

Platform: Mobile + Web | Build priority: P0

Portal shell: No independent shell. These screens appear inside every role shell and must share one component library.

Design emphasis: This portal applies the shared cinematic holographic system to shared trust, communication, signing, payment, identity and settings infrastructure. Preserve compact hierarchy, shared status language and the same component geometry used in Admin Dashboard.

Screen count: 17 screens. Screen IDs are stable routing and QA identifiers and must appear in code comments, route definitions or test names.

PORTAL GENERATION PROMPT Build the complete Shared Core Layer (SC) with 17 screens. Use this shell: No independent shell. These screens appear inside every role shell and must share one component library. Reuse the master design tokens and shared components. Optimize for shared trust, communication, signing, payment, identity and settings infrastructure. Implement every listed route, interaction and seeded state; maintain shared booking, negotiation, contract, payment and trust objects across portals.

SC-01 Splash Screen

Pattern: Utility • Platform: Mobile + Web • Priority: P0

Purpose & scope: Purpose: Brand moment + silent session check. Contents: Logo animation, version number, loading indicator. Logic: Check stored auth token → if valid, route to the user's default portal dashboard; if not, route to Onboarding (first launch) or Login. Also checks force-update flag from backend. Connects to: SC-02 Onboarding, SC-04 Login, or portal dashboard directly.

Layout & components: Use a branded, calm, centered state with one dominant recovery action, one secondary exit/help action, a concise explanation and optional diagnostic reference. Respect both themes and avoid decorative visual noise during failure states.

Functional contract: Retry, back, support and store/update actions must be clickable. Simulate recovery and route restoration so the screen is testable rather than decorative. Use shared seeded repositories for shared trust, communication, signing, payment, identity and settings infrastructure; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use a soft cinematic background vignette and one recognizable illustration/icon. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SC-01 — Splash Screen inside the established Shared Core Layer shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SC-02 Onboarding Carousel (3–4 slides)

Pattern: Workspace • Platform: Mobile + Web • Priority: P0

Purpose & scope: Purpose: Explain the value proposition in 15 seconds: "Find verified people → Negotiate formally → Sign digital contracts → Payments verified by the company." Contents: 3–4 illustrated slides, Skip button, "Get Started" CTA. Connects to: SC-03 Role Selection.

Layout & components: Use a compact page header, status/context strip, structured content cards, and a clear primary action. Desktop uses a 12-column grid; mobile uses one-column progressive disclosure. Keep the most frequent action within one tap/click.

Functional contract: All tabs, CTAs, menus and linked records must operate on shared seeded data. Every primary action creates visible feedback and routes or mutates state; no placeholder button may remain inert. Use shared seeded repositories for shared trust, communication, signing, payment, identity and settings infrastructure; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for contract, payment, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Apply glass to the shell and command surfaces while keeping data-heavy content on readable near-opaque panels. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SC-02 — Onboarding Carousel (3–4 slides) inside the established Shared Core Layer shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SC-03 Role Selection Screen

Pattern: Form • Platform: Mobile + Web • Priority: P0

Purpose & scope: Purpose: The single most important onboarding decision — determines which portal shell loads. Contents: Grid of role cards: Director/Producer, Actor/Talent, Model, Location Owner, Media/Equipment Provider, Crew/Services, Casting Agency, Brand/Sponsor, Partner (Legal/Insurance/Distribution). Each card shows a one-line description. Note under grid: "You can add more roles later." Data written: user.primary_role. Connects to: SC-05 Sign Up. Role choice also drives which Profile Setup wizard appears after verification.

Layout & components: Use a focused stepper or sectioned form with a sticky progress/header region, compact labelled fields, contextual helper text, inline validation, and a live summary or preview panel on wide screens. Mobile uses one column and a sticky bottom action bar. Preserve entered values when navigating backward.

Functional contract: All fields validate, conditional sections appear when triggered, attachments show previews, draft data persists, submit changes the correct demo entity and routes to the next logical screen with a success toast. Include validation-error and partially completed states. Use shared seeded repositories for shared trust, communication, signing, payment, identity and settings infrastructure; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for verification, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use luminous focus rings and a subtle progress gradient, not glowing every field. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SC-03 — Role Selection Screen inside the established Shared Core Layer shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SC-04 Login Screen

Pattern: Form • Platform: Mobile + Web • Priority: P0

Purpose & scope: Contents: Phone or email field, password, "Login with OTP instead" option, Forgot Password link, biometric login toggle (after first login). Connects to: SC-06 Forgot Password, SC-05 Sign Up, portal dashboard on success. If account status = "verification pending," routes to SC-08 instead.

Layout & components: Use a focused stepper or sectioned form with a sticky progress/header region, compact labelled fields, contextual helper text, inline validation, and a live summary or preview panel on wide screens. Mobile uses one column and a sticky bottom action bar. Preserve entered values when navigating backward.

Functional contract: All fields validate, conditional sections appear when triggered, attachments show previews, draft data persists, submit changes the correct demo entity and routes to the next logical screen with a success toast. Include validation-error and partially completed states. Use shared seeded repositories for shared trust, communication, signing, payment, identity and settings infrastructure; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for verification, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use luminous focus rings and a subtle progress gradient, not glowing every field. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SC-04 — Login Screen inside the established Shared Core Layer shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SC-05 Sign Up Screen (+ OTP Verification sub-screen)

Pattern: Form • Platform: Mobile + Web • Priority: P0

Purpose & scope: Contents: Full name, phone (primary in Pakistan market), email, password, city, referral code (optional), T&C checkbox. Then a 6-digit OTP entry sub-screen with resend timer. Data written: users table row, status = unverified. Connects to: SC-07 KYC Upload (mandatory before marketplace access for most roles).

Layout & components: Use a focused stepper or sectioned form with a sticky progress/header region, compact labelled fields, contextual helper text, inline validation, and a live summary or preview panel on wide screens. Mobile uses one column and a sticky bottom action bar. Preserve entered values when navigating backward.

Functional contract: All fields validate, conditional sections appear when triggered, attachments show previews, draft data persists, submit changes the correct demo entity and routes to the next logical screen with a success toast. Include validation-error and partially completed states. Use shared seeded repositories for shared trust, communication, signing, payment, identity and settings infrastructure; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for verification, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use luminous focus rings and a subtle progress gradient, not glowing every field. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SC-05 — Sign Up Screen (+ OTP Verification sub-screen) inside the established Shared Core Layer shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SC-06 Forgot Password / Reset Screen

Pattern: Form • Platform: Mobile + Web • Priority: P0

Purpose & scope: Standard OTP-based reset. Connects back to SC-04.

Layout & components: Use a focused stepper or sectioned form with a sticky progress/header region, compact labelled fields, contextual helper text, inline validation, and a live summary or preview panel on wide screens. Mobile uses one column and a sticky bottom action bar. Preserve entered values when navigating backward.

Functional contract: All fields validate, conditional sections appear when triggered, attachments show previews, draft data persists, submit changes the correct demo entity and routes to the next logical screen with a success toast. Include validation-

error and partially completed states. Use shared seeded repositories for shared trust, communication, signing, payment, identity and settings infrastructure; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use luminous focus rings and a subtle progress gradient, not glowing every field. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SC-06 — Forgot Password / Reset Screen inside the established Shared Core Layer shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SC-07 KYC / Verification Upload Screen

Pattern: Form • Platform: Mobile + Web • Priority: P0

Purpose & scope: Purpose: Feed the Super Admin Verification Queue. Nothing on this platform works without verified users — this screen is the trust gateway. Contents: Step wizard: (1) CNIC/passport front & back photo, (2) selfie/liveness capture, (3) role-specific docs — company registration for producers/agencies, property proof for location owners, business docs for equipment providers, (4) bank/payment account details for payees. Data written: kyc_submissions → appears in Admin screen SA-02. Connects to: SC-08 Verification Pending.

Layout & components: Use a focused stepper or sectioned form with a sticky progress/header region, compact labelled fields, contextual helper text, inline validation, and a live summary or preview panel on wide screens. Mobile uses one column and a sticky bottom action bar. Preserve entered values when navigating backward.

Functional contract: All fields validate, conditional sections appear when triggered, attachments show previews, draft data persists, submit changes the correct demo entity and routes to the next logical screen with a success toast. Include validation-error and partially completed states. Use shared seeded repositories for shared trust, communication, signing, payment, identity and settings infrastructure; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, verification, append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Use luminous focus rings and a subtle progress gradient, not glowing every field. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SC-07 — KYC / Verification Upload Screen inside the established Shared Core Layer shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SC-08 Verification Pending / Rejected Screen

Pattern: Detail • Platform: Mobile + Web • Priority: P0

Purpose & scope: Contents: Status card (Pending / Needs Resubmission with admin's rejection note / Approved). Limited browse-only marketplace preview can be allowed here to keep users engaged. Connects to: Admin approval flips user to their portal's Profile Setup wizard.

Layout & components: Use a two-column evidence/workspace layout on desktop: the primary content canvas and a sticky action/summary rail. Mobile collapses into ordered sections with critical actions in a persistent bottom bar. Keep identifiers, status, ownership and timestamps visible at the top.

Functional contract: Actions must mutate the shared demo object, append an audit/timeline event, show confirmation feedback and update upstream lists. Include normal, action-required, read-only, blocked and completed states where relevant. Use shared seeded repositories for shared trust, communication, signing, payment, identity and settings infrastructure; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for verification, closed, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use a fine cinematic divider and a low-opacity status aura behind the record identity block. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SC-08 — Verification Pending / Rejected Screen inside the established Shared Core Layer shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SC-09 Profile / Role Switcher

Pattern: Profile • Platform: Mobile + Web • Priority: P0

Purpose & scope: Purpose: One user, many hats (an actor who also owns a shootable house). Contents: Bottom sheet listing the user's active roles + "Add a new role" button (triggers role-specific KYC additions if needed). Connects to: Reloads the app shell into the selected portal. Every portal's top bar has this switcher.

Layout & components: Use a restrained cinematic identity header, trust badges, compact biography/metadata, and tabbed portfolio or operational sections. Media grids should prioritize aspect-ratio consistency, watermarked previews and fast filters. Editing uses a sheet or dedicated form without changing the public-view hierarchy.

Functional contract: Edit, reorder, filter, publish/unpublish and preview actions must work according to role. Media upload creates a local preview and moderation state. Trust/status elements must be driven by seeded data, not hard-coded

decoration. Use shared seeded repositories for shared trust, communication, signing, payment, identity and settings infrastructure; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for verification, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Media is the visual focus; UI chrome remains compact, translucent and secondary. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SC-09 — Profile / Role Switcher inside the established Shared Core Layer shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SC-10 Notification Center

Pattern: List • Platform: Mobile + Web • Priority: P0

Purpose & scope: Purpose: The nervous system. Every status change in the booking spine lands here. Contents: Tabbed list — All / Bookings / Payments / Contracts / System. Each notification deep-links to the exact screen (e.g., "Contract awaiting your signature" → opens SC-12 for that contract). Connects to: literally everything. Build deep-linking early; retrofitting it is painful.

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for shared trust, communication, signing, payment, identity and settings infrastructure; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for contract, payment, append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SC-10 — Notification Center inside the established Shared Core Layer shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SC-11 Booking-Level Chat Screen

Pattern: Conversation • Platform: Mobile + Web • Priority: P0

Purpose & scope: Purpose: Contained communication — every chat belongs to a booking, never floats free. Contents: Message thread, text/attachment/image sender, context header showing booking status badge + linked contract + payment status, "Pin decision" long-press action (pinned items can be converted to addendum requests), report button. Rules: Phone numbers auto-masked until booking status ≥ Secured (regex masking on send). Chat is evidence — it feeds the Dispute Case File. Connects to: Booking Detail (all portals), SC-12 Contract Viewer (via pinned decisions → addendum), SA-12 Dispute Case File (as...

Layout & components: Use a contextual header, structured timeline/thread, and a compact composer. Keep booking/project status, counterparty identity, contract and payment shortcuts accessible without dominating the message area. Desktop may use an evidence/sidebar rail; mobile uses expandable context sheets.

Functional contract: Sending text or attachments, pinning decisions, masking contact details, opening linked records and reporting content must work. Seed realistic chronological messages and system events; include failed-send retry and restricted-contact states. Use shared seeded repositories for shared trust, communication, signing, payment, identity and settings infrastructure; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for contract, payment, dispute, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Use neutral message bubbles with gold/cyan accents only for decisions, system events and action chips. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SC-11 — Booking-Level Chat Screen inside the established Shared Core Layer shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SC-12 Contract Viewer & E-Signing Screen

Pattern: Detail • Platform: Mobile + Web • Priority: P0

Purpose & scope: Purpose: The shared contract experience for ALL contract types (actor booking, model release, location agreement, equipment rental, crew, sponsorship, addendum). Contents: Rendered contract (PDF-style scroll view) with auto-filled terms highlighted, version selector dropdown, "Request Correction" button (sends back to negotiation as a new round), signature section (typed / drawn / OTP-confirmed), QR code + unique contract ID footer, download button (post-signing), KYC-lock banner if identity verification is required first. Data: Reads locked terms from the negotiation record; writes...

Layout & components: Use a two-column evidence/workspace layout on desktop: the primary content canvas and a sticky action/summary rail. Mobile collapses into ordered sections with critical actions in a persistent bottom bar. Keep identifiers, status, ownership and timestamps visible at the top.

Functional contract: Actions must mutate the shared demo object, append an audit/timeline event, show confirmation feedback and update upstream lists. Include normal, action-required, read-only, blocked and completed states where relevant. Use shared seeded repositories for shared trust, communication, signing, payment, identity and settings infrastructure; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, contract, payment, verification, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Use a fine cinematic divider and a low-opacity status aura behind the record identity block. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SC-12 — Contract Viewer & E-Signing Screen inside the established Shared Core Layer shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SC-13 Payment Proof Upload Screen

Pattern: Money • Platform: Mobile + Web • Priority: P0

Purpose & scope: Purpose: The payer side of the Payment Verification Engine. Contents: Milestone selector (deposit / milestone 1 / shoot-day / final / damage deposit — read from contract's payment schedule), amount field (pre-filled from milestone, editable with mismatch warning), payment method dropdown (bank transfer / wallet / gateway ref), proof image or PDF upload, transaction ID field, notes, submit → status becomes "Payment Under Verification." Risk controls (client-side hints, server-enforced): duplicate-proof hash check, amount mismatch alert. Connects to: Feeds SA-07 Payment Verification Queue....

Layout & components: Use money-safe hierarchy: totals and due items first, then milestone/status timeline, then ledger rows and receipts. Amount, currency, payer/payee, due date and verification status must never be visually ambiguous. Confirmation and destructive actions require explicit review modals.

Functional contract: Milestone actions, upload previews, verification outcomes, receipt opening, issue raising and ledger filtering must work. Simulate status transitions but never silently change an amount. Include pending, verified, rejected, partial, refunded and disputed examples. Use shared seeded repositories for shared trust, communication, signing, payment, identity and settings infrastructure; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for contract, payment, verification, secured booking, append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Amounts use tabular numerals; warning and verification states override decorative accents. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SC-13 — Payment Proof Upload Screen inside the established Shared Core Layer shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SC-14 Receipts & Ledger Screen (per user)

Pattern: Money • Platform: Mobile + Web • Priority: P0

Purpose & scope: Contents: Filterable list of all verified payments in/out, each row: project, booking, milestone, amount, status badge (not paid / pending verification / verified / partially paid / released / refunded / disputed / closed), tap → receipt detail with admin verification stamp, PDF download. Connects to: Booking Detail, Dispute Filing (payment disputes start from a ledger row).

Layout & components: Use money-safe hierarchy: totals and due items first, then milestone/status timeline, then ledger rows and receipts. Amount, currency, payer/payee, due date and verification status must never be visually ambiguous. Confirmation and destructive actions require explicit review modals.

Functional contract: Milestone actions, upload previews, verification outcomes, receipt opening, issue raising and ledger filtering must work. Simulate status transitions but never silently change an amount. Include pending, verified, rejected, partial, refunded and disputed examples. Use shared seeded repositories for shared trust, communication, signing, payment, identity and settings infrastructure; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, verification, dispute, append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Amounts use tabular numerals; warning and verification states override decorative accents. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SC-14 — Receipts & Ledger Screen (per user) inside the established Shared Core Layer shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SC-15 Ratings & Review Screen

Pattern: Form • Platform: Mobile + Web • Priority: P0

Purpose & scope: Trigger: Automatic prompt when booking status = Closed (both directions). Contents: Star rating + category chips (punctuality, professionalism, quality, communication), text review, anonymous complaint option routed to admin instead of public. Connects to: Public profile trust badges, SA analytics, repeat-booking score.

Layout & components: Use a focused stepper or sectioned form with a sticky progress/header region, compact labelled fields, contextual helper text, inline validation, and a live summary or preview panel on wide screens. Mobile uses one column and a sticky bottom action bar. Preserve entered values when navigating backward.

Functional contract: All fields validate, conditional sections appear when triggered, attachments show previews, draft data persists, submit changes the correct demo entity and routes to the next logical screen with a success toast. Include validation-error and partially completed states. Use shared seeded repositories for shared trust, communication, signing, payment, identity and settings infrastructure; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for closed, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use luminous focus rings and a subtle progress gradient, not glowing every field. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SC-15 — Ratings & Review Screen inside the established Shared Core Layer shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SC-16 Report & Block Screen

Pattern: Form • Platform: Mobile + Web • Priority: P0

Purpose & scope: Contents: Reason picker (fake offer, harassment, fake profile, payment fraud, stolen portfolio content, image misuse), evidence attachment, submit → creates admin support/moderation ticket. Block toggle hides the user both ways. Connects to: SA-15 Support CRM, SA-04 Profile Moderation.

Layout & components: Use a focused stepper or sectioned form with a sticky progress/header region, compact labelled fields, contextual helper text, inline validation, and a live summary or preview panel on wide screens. Mobile uses one column and a sticky bottom action bar. Preserve entered values when navigating backward.

Functional contract: All fields validate, conditional sections appear when triggered, attachments show previews, draft data persists, submit changes the correct demo entity and routes to the next logical screen with a success toast. Include validation-error and partially completed states. Use shared seeded repositories for shared trust, communication, signing, payment, identity and settings infrastructure; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, payment, verification, dispute, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Use luminous focus rings and a subtle progress gradient, not glowing every field. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SC-16 — Report & Block Screen inside the established Shared Core Layer shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SC-17 Settings & Account Screen

Pattern: Settings • Platform: Mobile + Web • Priority: P0

Purpose & scope: Contents: Edit basic info, change password, notification channel preferences (in-app/push/email/SMS/WhatsApp consent toggles), language (English / Urdu / Roman Urdu), privacy controls, linked bank/payment accounts (changes trigger OTP + admin high-value review alert), delete/deactivate account, help center. Connects to: SC-07 (re-KYC on payment account change), Support CRM. System/Utility screens (5, build alongside): Error/retry screen, Empty-state templates, No-internet screen, Force-update screen, Maintenance-mode screen.

Layout & components: Use categorized settings cards with concise labels, current values and immediate feedback. Avoid long undifferentiated forms. Sensitive changes require OTP/re-authentication simulation and confirmation. Changes must update the visible app immediately and persist locally.

Functional contract: Toggles, selectors and save actions apply immediately, persist in local storage and trigger any necessary confirmation simulation. Include permission denied, re-authentication and reset-to-default behavior. Use shared seeded repositories for shared trust, communication, signing, payment, identity and settings infrastructure; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, verification, closed, append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Use clean grouped surfaces and restrained accent indicators. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SC-17 — Settings & Account Screen inside the established Shared Core Layer shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

8. System & Utility States

Platform: Mobile + Web | Build priority: P0

Portal shell: Rendered globally above the active route or as reusable state components.

Design emphasis: This portal applies the shared cinematic holographic system to resilient system feedback and recovery behavior. Preserve compact hierarchy, shared status language and the same component geometry used in Admin Dashboard.

Screen count: 5 screens. Screen IDs are stable routing and QA identifiers and must appear in code comments, route definitions or test names.

PORTAL GENERATION PROMPT Build the complete System & Utility States (UT) with 5 screens. Use this shell: Rendered globally above the active route or as reusable state components. Reuse the master design tokens and shared components. Optimize for resilient system feedback and recovery behavior. Implement every listed route, interaction and seeded state; maintain shared booking, negotiation, contract, payment and trust objects across portals.

UT-01 Error & Retry Screen

Pattern: Utility • Platform: Mobile + Web • Priority: P0

Purpose & scope: Reusable full-page and inline error state with a clear message, technical reference code, retry action, back action, and support link.

Layout & components: Use a branded, calm, centered state with one dominant recovery action, one secondary exit/help action, a concise explanation and optional diagnostic reference. Respect both themes and avoid decorative visual noise during failure states.

Functional contract: Retry, back, support and store/update actions must be clickable. Simulate recovery and route restoration so the screen is testable rather than decorative. Use shared seeded repositories for resilient system feedback and recovery behavior; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use a soft cinematic background vignette and one recognizable illustration/icon. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create UT-01 — Error & Retry Screen inside the established System & Utility States shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

UT-02 Empty-State Templates

Pattern: Utility • Platform: Mobile + Web • Priority: P0

Purpose & scope: Reusable empty states for no projects, no opportunities, no payments, no messages, no listings, no search results, and permission-restricted content.

Layout & components: Use a branded, calm, centered state with one dominant recovery action, one secondary exit/help action, a concise explanation and optional diagnostic reference. Respect both themes and avoid decorative visual noise during failure states.

Functional contract: Retry, back, support and store/update actions must be clickable. Simulate recovery and route restoration so the screen is testable rather than decorative. Use shared seeded repositories for resilient system feedback and recovery behavior; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Use a soft cinematic background vignette and one recognizable illustration/icon. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create UT-02 — Empty-State Templates inside the established System & Utility States shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

UT-03 No-Internet Screen

Pattern: Utility • Platform: Mobile + Web • Priority: P0

Purpose & scope: Offline state that preserves cached information, explains unavailable actions, and retries automatically when connectivity returns.

Layout & components: Use a branded, calm, centered state with one dominant recovery action, one secondary exit/help action, a concise explanation and optional diagnostic reference. Respect both themes and avoid decorative visual noise during failure states.

Functional contract: Retry, back, support and store/update actions must be clickable. Simulate recovery and route restoration so the screen is testable rather than decorative. Use shared seeded repositories for resilient system feedback and recovery behavior; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use a soft cinematic background vignette and one recognizable illustration/icon. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create UT-03 — No-Internet Screen inside the established System & Utility States shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

UT-04 Force-Update Screen

Pattern: Utility • Platform: Mobile + Web • Priority: PO

Purpose & scope: Blocking update screen driven by a remote minimum-version flag, with release notes and direct store action.

Layout & components: Use a branded, calm, centered state with one dominant recovery action, one secondary exit/help action, a concise explanation and optional diagnostic reference. Respect both themes and avoid decorative visual noise during failure states.

Functional contract: Retry, back, support and store/update actions must be clickable. Simulate recovery and route restoration so the screen is testable rather than decorative. Use shared seeded repositories for resilient system feedback and recovery behavior; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for dispute, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use a soft cinematic background vignette and one recognizable illustration/icon. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create UT-04 — Force-Update Screen inside the established System & Utility States shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

UT-05 Maintenance-Mode Screen

Pattern: Utility • Platform: Mobile + Web • Priority: PO

Purpose & scope: Branded maintenance state with expected service scope, cached support contact, and automatic retry.

Layout & components: Use a branded, calm, centered state with one dominant recovery action, one secondary exit/help action, a concise explanation and optional diagnostic reference. Respect both themes and avoid decorative visual noise during failure states.

Functional contract: Retry, back, support and store/update actions must be clickable. Simulate recovery and route restoration so the screen is testable rather than decorative. Use shared seeded repositories for resilient system feedback and recovery behavior; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use a soft cinematic background vignette and one recognizable illustration/icon. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create UT-05 — Maintenance-Mode Screen inside the established System & Utility States shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

9. Super Admin / Company Control Portal

Platform: Web only | Build priority: P0

Portal shell: Collapsible left navigation, 64 px command bar, global search, queue badges, role avatar, audit-safe action drawers.

Design emphasis: This portal applies the shared cinematic holographic system to high-density operational control, verification, risk and auditability. Preserve compact hierarchy, shared status language and the same component geometry used in Admin Dashboard.

Screen count: 18 screens. Screen IDs are stable routing and QA identifiers and must appear in code comments, route definitions or test names.

PORTAL GENERATION PROMPT Build the complete Super Admin / Company Control Portal (SA) with 18 screens. Use this shell: Collapsible left navigation, 64 px command bar, global search, queue badges, role avatar, audit-safe action drawers. Reuse the master design tokens and shared components. Optimize for high-density operational control, verification, risk and auditability. Implement every listed route, interaction and seeded state; maintain shared booking, negotiation, contract, payment and trust objects across portals.

SA-01 Admin Dashboard (Home)

Pattern: Dashboard • Platform: Web only • Priority: P0

Purpose & scope: Contents: KPI cards — pending verifications, pending payment proofs, open disputes, active negotiations, bookings secured today, revenue this month. Action-required feed sorted by SLA age. Quick links to every queue. Connects to: Every other admin screen; it's the router.

Layout & components: Use a compact command header, one horizontal KPI rail, a primary work canvas, and a narrower action-required rail. On mobile, convert the KPI rail to horizontally scrollable cards and place urgent tasks before analytics. Do not use oversized hero cards; information density and immediate action take priority.

Functional contract: Seed realistic cards, alerts and trends. KPI cards open filtered destinations; task rows can be completed or snoozed; carousels, tabs and quick actions must update local state. Include healthy, urgent and no-activity variants. Use shared seeded repositories for high-density operational control, verification, risk and auditability; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, payment, verification, dispute, append a timeline/audit event and refresh connected counters. Notify the affected user(s), assigned operations staff and audit stream when an action changes status.

Visual / responsive direction: Use one restrained holographic focal glow behind the primary workload card; secondary cards remain neutral glass. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SA-01 — Admin Dashboard (Home) inside the established Super Admin / Company Control Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SA-02 User Verification Queue

Pattern: List • Platform: Web only • Priority: P0

Purpose & scope: Contents: Table of pending KYC submissions filterable by role, city, age of request. Row shows: name, role, docs submitted, risk flags (duplicate CNIC, duplicate device, mismatched name). Bulk assign to admin staff. Connects to: SA-03 detail view. Approval → user unlocked into their portal (SC-08 flips).

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for high-density operational control, verification, risk and auditability; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for verification, append a timeline/audit event and refresh connected counters. Notify the affected user(s), assigned operations staff and audit stream when an action changes status.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SA-02 — User Verification Queue inside the established Super Admin / Company Control Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SA-03 KYC / KYB Review Detail

Pattern: Detail • Platform: Web only • Priority: P0

Purpose & scope: Contents: Side-by-side document viewer (CNIC front/back, selfie match, company registration, bank details, address proof), checklist of verification steps, risk notes field, Approve / Reject-with-reason / Request-more-info buttons. Every decision writes to audit log. Connects to: SC-07/SC-08 on the user side; SA-17 Audit Logs.

Layout & components: Use a two-column evidence/workspace layout on desktop: the primary content canvas and a sticky action/summary rail. Mobile collapses into ordered sections with critical actions in a persistent bottom bar. Keep identifiers, status, ownership and timestamps visible at the top.

Functional contract: Actions must mutate the shared demo object, append an audit/timeline event, show confirmation feedback and update upstream lists. Include normal, action-required, read-only, blocked and completed states where relevant. Use shared seeded repositories for high-density operational control, verification, risk and auditability; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for verification, closed, append a timeline/audit event and refresh connected counters. Notify the affected user(s), assigned operations staff and audit stream when an action changes status.

Visual / responsive direction: Use a fine cinematic divider and a low-opacity status aura behind the record identity block. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SA-03 — KYC / KYB Review Detail inside the established Super Admin / Company Control Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SA-04 Profile & Content Moderation Queue

Pattern: List • Platform: Web only • Priority: P0

Purpose & scope: Contents: Grid of newly uploaded portfolio photos/videos, location images, rate claims, and reported content. Approve / remove / warn actions. Watermark check indicator for public previews. Connects to: User profiles (public visibility flag), SC-16 reports feed here, SA-15 Support CRM for warnings.

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for high-density operational control, verification, risk and auditability; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for verification, dispute, closed, append a timeline/audit event and refresh connected counters. Notify the affected user(s), assigned operations staff and audit stream when an action changes status.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SA-04 — Profile & Content Moderation Queue inside the established Super Admin / Company Control Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SA-05 Listings Moderation (Locations, Equipment, Packages)

Pattern: List • Platform: Web only • Priority: P0

Purpose & scope: Contents: Same pattern as SA-04 but for listings: photos genuine? Address hidden properly? Pricing sane? Deposit terms clear? Approve/reject with note. Connects to: Location Owner & Media portals (listing goes live only after approval).

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for high-density operational control, verification, risk and auditability; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, verification, append a timeline/audit event and refresh connected counters. Notify the affected user(s), assigned operations staff and audit stream when an action changes status.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SA-05 — Listings Moderation (Locations, Equipment, Packages) inside the established Super Admin / Company Control Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SA-06 Booking & Negotiation Monitor

Pattern: List • Platform: Web only • Priority: P0

Purpose & scope: Contents: Live table of all bookings by status (the 13-status spine), filters by category/city/value, drill into any booking read-only: negotiation rounds, chat (visible for compliance), contract state, payment state. Flag-booking action for suspicious patterns. Connects to: SA-12 Dispute Center (flagged bookings), SA-07 Payments, SA-18 Analytics.

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for high-density operational control, verification, risk and auditability; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, contract, payment, dispute, append a timeline/audit event and refresh connected counters. Notify the affected user(s), assigned operations staff and audit stream when an action changes status.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SA-06 — Booking & Negotiation Monitor inside the established Super Admin / Company Control Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SA-07 Payment Verification Queue (the money screen)

Pattern: Money • Platform: Web only • Priority: P0

Purpose & scope: Contents: Queue of uploaded proofs, each row: booking ID, contract ID, payer, payee, milestone, expected amount vs claimed amount (mismatch highlighted red), duplicate-proof warning, proof thumbnail. Sort by value and age. Connects to: SA-08 detail.

Layout & components: Use money-safe hierarchy: totals and due items first, then milestone/status timeline, then ledger rows and receipts. Amount, currency, payer/payee, due date and verification status must never be visually ambiguous. Confirmation and destructive actions require explicit review modals.

Functional contract: Milestone actions, upload previews, verification outcomes, receipt opening, issue raising and ledger filtering must work. Simulate status transitions but never silently change an amount. Include pending, verified, rejected, partial, refunded and disputed examples. Use shared seeded repositories for high-density operational control, verification, risk and auditability; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for contract, payment, verification, dispute, append a timeline/audit event and refresh connected counters. Notify the affected user(s), assigned operations staff and audit stream when an action changes status.

Visual / responsive direction: Amounts use tabular numerals; warning and verification states override decorative accents. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SA-07 — Payment Verification Queue (the money screen) inside the established Super Admin / Company Control Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SA-08 Payment Review Detail

Pattern: Money • Platform: Web only • Priority: P0

Purpose & scope: Contents: Full proof image/PDF viewer, booking + contract summary panel (so the admin verifies against the actual agreed schedule), payer/payee bank details on file, action buttons: Verify / Reject with reason / Ask for clarification (opens message to payer). On Verify → booking status auto-advances, receipts auto-generate for producer, payee, and company, ledger entries written. Connects to: SC-13 (source), SC-14 ledgers (output), booking spine, SA-17 audit log.

Layout & components: Use money-safe hierarchy: totals and due items first, then milestone/status timeline, then ledger rows and receipts. Amount, currency, payer/payee, due date and verification status must never be visually ambiguous. Confirmation and destructive actions require explicit review modals.

Functional contract: Milestone actions, upload previews, verification outcomes, receipt opening, issue raising and ledger filtering must work. Simulate status transitions but never silently change an amount. Include pending, verified, rejected, partial, refunded and disputed examples. Use shared seeded repositories for high-density operational control, verification, risk and auditability; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for contract, payment, secured booking, closed, append a timeline/audit event and refresh connected counters. Notify the affected user(s), assigned operations staff and audit stream when an action changes status.

Visual / responsive direction: Amounts use tabular numerals; warning and verification states override decorative accents. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SA-08 — Payment Review Detail inside the established Super Admin / Company Control Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SA-09 Contract Template Manager

Pattern: List • Platform: Web only • Priority: P0

Purpose & scope: Contents: CRUD for the 9 template types (actor booking, model release, location, equipment rental, crew, sponsorship, addendum, cancellation/rescheduling, damage-claim record). Clause editor with required-field placeholders ({{fee}}, {{dates}}, {{usage_rights}}...), version control per template, category-specific mandatory clause rules (e.g., model contracts MUST contain usage rights block or generation is blocked). Connects to: SC-12 renders from these templates; Legal Partner portal can propose template edits here.

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for high-density operational control, verification, risk and auditability; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for contract, dispute, append a timeline/audit event and refresh connected counters. Notify the affected user(s), assigned operations staff and audit stream when an action changes status.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SA-09 — Contract Template Manager inside the established Super Admin / Company Control Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SA-10 Commission & Fee Management

Pattern: Money • Platform: Web only • Priority: P0

Purpose & scope: Contents: Platform fee % per category, subscription plan editor, featured-listing pricing, verification fee settings, invoice generation, company revenue view. Connects to: SA-18 Analytics revenue tab, receipts engine.

Layout & components: Use money-safe hierarchy: totals and due items first, then milestone/status timeline, then ledger rows and receipts. Amount, currency, payer/payee, due date and verification status must never be visually ambiguous. Confirmation and destructive actions require explicit review modals.

Functional contract: Milestone actions, upload previews, verification outcomes, receipt opening, issue raising and ledger filtering must work. Simulate status transitions but never silently change an amount. Include pending, verified, rejected, partial, refunded and disputed examples. Use shared seeded repositories for high-density operational control, verification, risk and auditability; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, verification, append a timeline/audit event and refresh connected counters. Notify the affected user(s), assigned operations staff and audit stream when an action changes status.

Visual / responsive direction: Amounts use tabular numerals; warning and verification states override decorative accents. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SA-10 — Commission & Fee Management inside the established Super Admin / Company Control Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SA-11 Dispute Center (List)

Pattern: List • Platform: Web only • Priority: P0

Purpose & scope: Contents: Case queue: dispute type (payment / completion / cancellation / location damage / equipment damage / harassment-safety), parties, booking value, age, assigned admin, status (new / evidence gathering / decision pending / resolved). Connects to: SA-12.

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for high-density operational control, verification, risk and auditability; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, dispute, append a timeline/audit event and refresh connected counters. Notify the affected user(s), assigned operations staff and audit stream when an action changes status.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SA-11 — Dispute Center (List) inside the established Super Admin / Company Control Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SA-12 Dispute Case File (single-screen evidence room)

Pattern: Detail • Platform: Web only • Priority: P0

Purpose & scope: Contents: One screen assembling everything automatically: the contract (all versions), full negotiation timeline, complete booking chat, payment proofs + ledger, completion proofs, inspection/handover photos (for location/equipment cases), report forms, prior dispute history of both parties. Decision panel: ruling text, refund/release instruction, penalty flags, close case. Decision is final-logged and both parties notified. Connects to: Pulls from SC-11, SC-12, SC-13/14, inspection checklists; writes to audit log + ledger (refunds).

Layout & components: Use a two-column evidence/workspace layout on desktop: the primary content canvas and a sticky action/summary rail. Mobile collapses into ordered sections with critical actions in a persistent bottom bar. Keep identifiers, status, ownership and timestamps visible at the top.

Functional contract: Actions must mutate the shared demo object, append an audit/timeline event, show confirmation feedback and update upstream lists. Include normal, action-required, read-only, blocked and completed states where relevant.

Use shared seeded repositories for high-density operational control, verification, risk and auditability; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, contract, payment, dispute, append a timeline/audit event and refresh connected counters. Notify the affected user(s), assigned operations staff and audit stream when an action changes status.

Visual / responsive direction: Use a fine cinematic divider and a low-opacity status aura behind the record identity block. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SA-12 — Dispute Case File (single-screen evidence room) inside the established Super Admin / Company Control Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SA-13 User Management (All Users)

Pattern: Workspace • Platform: Web only • Priority: P0

Purpose & scope: Contents: Master searchable directory, user detail drawer (roles, verification state, bookings, disputes, trust badges, device info), actions: suspend, unverify, force re-KYC, merge duplicate, reset access. Connects to: Everything user-related.

Layout & components: Use a compact page header, status/context strip, structured content cards, and a clear primary action. Desktop uses a 12-column grid; mobile uses one-column progressive disclosure. Keep the most frequent action within one tap/click.

Functional contract: All tabs, CTAs, menus and linked records must operate on shared seeded data. Every primary action creates visible feedback and routes or mutates state; no placeholder button may remain inert. Use shared seeded repositories for high-density operational control, verification, risk and auditability; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for verification, dispute, append a timeline/audit event and refresh connected counters. Notify the affected user(s), assigned operations staff and audit stream when an action changes status.

Visual / responsive direction: Apply glass to the shell and command surfaces while keeping data-heavy content on readable near-opaque panels. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SA-13 — User Management (All Users) inside the established Super Admin / Company Control Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SA-14 Admin Roles & Permissions

Pattern: Workspace • Platform: Web only • Priority: P0

Purpose & scope: Contents: Admin staff accounts, permission matrix (verification agent, payments officer, dispute officer, content moderator, super admin), 2FA enforcement, session management. Why it matters: the proposal promises "permission-based" admin — build the matrix before hiring staff.

Layout & components: Use a compact page header, status/context strip, structured content cards, and a clear primary action. Desktop uses a 12-column grid; mobile uses one-column progressive disclosure. Keep the most frequent action within one tap/click.

Functional contract: All tabs, CTAs, menus and linked records must operate on shared seeded data. Every primary action creates visible feedback and routes or mutates state; no placeholder button may remain inert. Use shared seeded repositories for high-density operational control, verification, risk and auditability; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, verification, dispute, append a timeline/audit event and refresh connected counters. Notify the affected user(s), assigned operations staff and audit stream when an action changes status.

Visual / responsive direction: Apply glass to the shell and command surfaces while keeping data-heavy content on readable near-opaque panels. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SA-14 — Admin Roles & Permissions inside the established Super Admin / Company Control Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SA-15 Support CRM / Tickets

Pattern: Workspace • Platform: Web only • Priority: P0

Purpose & scope: Contents: Ticket queue from SC-16 reports + SC-17 help requests + verification rejections follow-ups + onboarding call notes, ticket detail with canned responses, status workflow. Connects to: SC-16, SA-04, notification system.

Layout & components: Use a compact page header, status/context strip, structured content cards, and a clear primary action. Desktop uses a 12-column grid; mobile uses one-column progressive disclosure. Keep the most frequent action within one tap/click.

Functional contract: All tabs, CTAs, menus and linked records must operate on shared seeded data. Every primary action creates visible feedback and routes or mutates state; no placeholder button may remain inert. Use shared seeded repositories for high-density operational control, verification, risk and auditability; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for verification, dispute, append a timeline/audit event and refresh connected counters. Notify the affected user(s), assigned operations staff and audit stream when an action changes status.

Visual / responsive direction: Apply glass to the shell and command surfaces while keeping data-heavy content on readable near-opaque panels. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SA-15 — Support CRM / Tickets inside the established Super Admin / Company Control Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SA-16 Broadcast & Announcements

Pattern: Workspace • Platform: Web only • Priority: P0

Purpose & scope: Contents: Compose announcements to segments (all actors in Lahore, all location owners, etc.), channel selection, schedule. Connects to: SC-10 Notification Center.

Layout & components: Use a compact page header, status/context strip, structured content cards, and a clear primary action. Desktop uses a 12-column grid; mobile uses one-column progressive disclosure. Keep the most frequent action within one tap/click.

Functional contract: All tabs, CTAs, menus and linked records must operate on shared seeded data. Every primary action creates visible feedback and routes or mutates state; no placeholder button may remain inert. Use shared seeded repositories for high-density operational control, verification, risk and auditability; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for secured booking, append a timeline/audit event and refresh connected counters. Notify the affected user(s), assigned operations staff and audit stream when an action changes status.

Visual / responsive direction: Apply glass to the shell and command surfaces while keeping data-heavy content on readable near-opaque panels. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SA-16 — Broadcast & Announcements inside the established Super Admin / Company Control Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SA-17 Audit Log Explorer

Pattern: Form • Platform: Web only • Priority: P0

Purpose & scope: Contents: Filterable immutable log: verifications, profile changes, signatures, payment approvals, dispute decisions, admin actions, account/bank changes. Export. Connects to: Read-only view over events written by every sensitive action platform-wide.

Layout & components: Use a focused stepper or sectioned form with a sticky progress/header region, compact labelled fields, contextual helper text, inline validation, and a live summary or preview panel on wide screens. Mobile uses one column and a sticky bottom action bar. Preserve entered values when navigating backward.

Functional contract: All fields validate, conditional sections appear when triggered, attachments show previews, draft data persists, submit changes the correct demo entity and routes to the next logical screen with a success toast. Include validation-error and partially completed states. Use shared seeded repositories for high-density operational control, verification, risk and auditability; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, verification, dispute, append a timeline/audit event and refresh connected counters. Notify the affected user(s), assigned operations staff and audit stream when an action changes status.

Visual / responsive direction: Use luminous focus rings and a subtle progress gradient, not glowing every field. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SA-17 — Audit Log Explorer inside the established Super Admin / Company Control Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

SA-18 Analytics Dashboard

Pattern: Dashboard • Platform: Web only • Priority: P0

Purpose & scope: Contents: Tabs matching the proposal — Marketplace Growth, Demand, Conversion funnel (requests → negotiations → contracts → verified payments), Trust metrics (verification time, dispute rate, cancellation rate, fake-profile rejection rate), Revenue, Retention. Connects to: Reads the whole database; exportable for investor/partner reporting.

Layout & components: Use a compact command header, one horizontal KPI rail, a primary work canvas, and a narrower action-required rail. On mobile, convert the KPI rail to horizontally scrollable cards and place urgent tasks before analytics. Do not use oversized hero cards; information density and immediate action take priority.

Functional contract: Seed realistic cards, alerts and trends. KPI cards open filtered destinations; task rows can be completed or snoozed; carousels, tabs and quick actions must update local state. Include healthy, urgent and no-activity variants. Use shared seeded repositories for high-density operational control, verification, risk and auditability; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, contract, payment, verification, append a timeline/audit event and refresh connected counters. Notify the affected user(s), assigned operations staff and audit stream when an action changes status.

Visual / responsive direction: Use one restrained holographic focal glow behind the primary workload card; secondary cards remain neutral glass. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create SA-18 — Analytics Dashboard inside the established Super Admin / Company Control Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

10. Director / Producer Portal

Platform: Mobile + Web | Build priority: P1

Portal shell: Desktop side rail plus mobile five-tab bottom navigation: Home, Projects, Discover, Actions, Profile. Project context stays visible.

Design emphasis: This portal applies the shared cinematic holographic system to project-led discovery, hiring, negotiation and production coordination. Preserve compact hierarchy, shared status language and the same component geometry used in Admin Dashboard.

Screen count: 18 screens. Screen IDs are stable routing and QA identifiers and must appear in code comments, route definitions or test names.

PORTAL GENERATION PROMPT Build the complete Director / Producer Portal (DP) with 18 screens. Use this shell: Desktop side rail plus mobile five-tab bottom navigation: Home, Projects, Discover, Actions, Profile. Project context stays visible. Reuse the master design tokens and shared components. Optimize for project-led discovery, hiring, negotiation and production coordination. Implement every listed route, interaction and seeded state; maintain shared booking, negotiation, contract, payment and trust objects across portals.

DP-01 Home Dashboard

Pattern: Dashboard • Platform: Mobile + Web • Priority: P1

Purpose & scope: Contents: Active projects carousel, action-required strip (contracts to sign, payments to upload, offers awaiting response, expiring negotiations with countdown timers), upcoming shoot days, quick "New Project" FAB. Connects to: DP-02, DP-11, DP-13, DP-14, DP-15.

Layout & components: Use a compact command header, one horizontal KPI rail, a primary work canvas, and a narrower action-required rail. On mobile, convert the KPI rail to horizontally scrollable cards and place urgent tasks before analytics. Do not use oversized hero cards; information density and immediate action take priority.

Functional contract: Seed realistic cards, alerts and trends. KPI cards open filtered destinations; task rows can be completed or snoozed; carousels, tabs and quick actions must update local state. Include healthy, urgent and no-activity variants. Use shared seeded repositories for project-led discovery, hiring, negotiation and production coordination; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, contract, payment, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Use one restrained holographic focal glow behind the primary workload card; secondary cards remain neutral glass. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create DP-01 — Home Dashboard inside the established Director / Producer Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

DP-02 Projects List

Pattern: List • Platform: Mobile + Web • Priority: P1

Purpose & scope: Contents: Cards per project: type badge (film/drama/TVC/music video/web series/short film/fashion shoot/brand campaign), status, budget health bar, pending actions count, team avatars. Connects to: DP-03 Create, DP-04 Detail.

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for project-led discovery, hiring, negotiation and production coordination; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create DP-02 — Projects List inside the established Director / Producer Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

DP-03 Create Project Wizard

Pattern: Form • Platform: Mobile + Web • Priority: P1

Purpose & scope: Steps: (1) Type + title + description, (2) city/cities + date range, (3) budget range, (4) team members invite (co-producer, production manager with permission levels). Data written: projects row — the parent object every booking hangs from. Connects to: DP-04, then naturally into DP-05.

Layout & components: Use a focused stepper or sectioned form with a sticky progress/header region, compact labelled fields, contextual helper text, inline validation, and a live summary or preview panel on wide screens. Mobile uses one column and a sticky bottom action bar. Preserve entered values when navigating backward.

Functional contract: All fields validate, conditional sections appear when triggered, attachments show previews, draft data persists, submit changes the correct demo entity and routes to the next logical screen with a success toast. Include validation-error and partially completed states. Use shared seeded repositories for project-led discovery, hiring, negotiation and production coordination; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use luminous focus rings and a subtle progress gradient, not glowing every field. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create DP-03 — Create Project Wizard inside the established Director / Producer Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

DP-04 Project Detail (Hub Screen)

Pattern: Detail • Platform: Mobile + Web • Priority: P1

Purpose & scope: Contents: Tabbed hub — Overview / Requirements / Bookings / Contracts / Payments / Schedule / Room / Reports. Status summary across the 13-status spine for all bookings in this project. Connects to: This is the container for DP-05 through DP-18. Every booking-related deep link from notifications lands inside here.

Layout & components: Use a two-column evidence/workspace layout on desktop: the primary content canvas and a sticky action/summary rail. Mobile collapses into ordered sections with critical actions in a persistent bottom bar. Keep identifiers, status, ownership and timestamps visible at the top.

Functional contract: Actions must mutate the shared demo object, append an audit/timeline event, show confirmation feedback and update upstream lists. Include normal, action-required, read-only, blocked and completed states where relevant. Use shared seeded repositories for project-led discovery, hiring, negotiation and production coordination; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for contract, payment, dispute, secured booking, append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Use a fine cinematic divider and a low-opacity status aura behind the record identity block. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create DP-04 — Project Detail (Hub Screen) inside the established Director / Producer Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

DP-05 Requirement Builder

Pattern: Form • Platform: Mobile + Web • Priority: P1

Purpose & scope: Contents: "Add requirement" per category: Role (character name, gender, age range, look type, language, dates, fee range, usage rights, travel/accommodation/wardrobe notes), Model requirement (campaign type, usage rights, look), Location need (scene description, property type, dates), Media package need, Crew requirement. Each requirement becomes a matchable card. Connects to: DP-06 (each requirement has "Find matches" button carrying its filters), later AI Casting Assistant and AI Script Breakdown pre-fill this screen.

Layout & components: Use a focused stepper or sectioned form with a sticky progress/header region, compact labelled fields, contextual helper text, inline validation, and a live summary or preview panel on wide screens. Mobile uses one column and a sticky bottom action bar. Preserve entered values when navigating backward.

Functional contract: All fields validate, conditional sections appear when triggered, attachments show previews, draft data persists, submit changes the correct demo entity and routes to the next logical screen with a success toast. Include validation-error and partially completed states. Use shared seeded repositories for project-led discovery, hiring, negotiation and production coordination; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use luminous focus rings and a subtle progress gradient, not glowing every field. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create DP-05 — Requirement Builder inside the established Director / Producer Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

DP-06 Marketplace Discovery / Search

Pattern: Workspace • Platform: Mobile + Web • Priority: P1

Purpose & scope: Contents: Category tabs (Talent / Models / Locations / Media & Equipment / Crew / Agencies / Partners), search bar, result cards (photo, name/stage name, city, rate range, rating, verified badge, availability dot), map view toggle for locations. Connects to: DP-07 Filters, DP-08 Profile Detail, DP-09 Shortlist (heart icon on cards).

Layout & components: Use a compact page header, status/context strip, structured content cards, and a clear primary action. Desktop uses a 12-column grid; mobile uses one-column progressive disclosure. Keep the most frequent action within one tap/click.

Functional contract: All tabs, CTAs, menus and linked records must operate on shared seeded data. Every primary action creates visible feedback and routes or mutates state; no placeholder button may remain inert. Use shared seeded repositories for project-led discovery, hiring, negotiation and production coordination; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Apply glass to the shell and command surfaces while keeping data-heavy content on readable near-opaque panels. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create DP-06 — Marketplace Discovery / Search inside the established Director / Producer Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

DP-07 Smart Filters Sheet

Pattern: Workspace • Platform: Mobile + Web • Priority: P1

Purpose & scope: Contents: City, availability dates, rate range slider, experience, language, age range, look type, rating minimum, verified-only toggle, past-work category. Filters persist per requirement. Connects to: DP-06 results.

Layout & components: Use a compact page header, status/context strip, structured content cards, and a clear primary action. Desktop uses a 12-column grid; mobile uses one-column progressive disclosure. Keep the most frequent action within one tap/click.

Functional contract: All tabs, CTAs, menus and linked records must operate on shared seeded data. Every primary action creates visible feedback and routes or mutates state; no placeholder button may remain inert. Use shared seeded repositories for project-led discovery, hiring, negotiation and production coordination; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Apply glass to the shell and command surfaces while keeping data-heavy content on readable near-opaque panels. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create DP-07 — Smart Filters Sheet inside the established Director / Producer Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

DP-08 Stakeholder Profile Detail (viewing others)

Pattern: Detail • Platform: Mobile + Web • Priority: P1

Purpose & scope: Contents: Portfolio/showreel gallery (watermarked), bio, skills, rates card, availability calendar (read-only), ratings & reviews, trust badges, dispute-free indicator, "Add to shortlist" and "Send Booking Request" CTAs. Phone/exact address hidden with lock icon + explainer. Connects to: DP-09, DP-10. This same component renders location listings and equipment packages with their specific sections (rules, deposits, inventory).

Layout & components: Use a two-column evidence/workspace layout on desktop: the primary content canvas and a sticky action/summary rail. Mobile collapses into ordered sections with critical actions in a persistent bottom bar. Keep identifiers, status, ownership and timestamps visible at the top.

Functional contract: Actions must mutate the shared demo object, append an audit/timeline event, show confirmation feedback and update upstream lists. Include normal, action-required, read-only, blocked and completed states where relevant. Use shared seeded repositories for project-led discovery, hiring, negotiation and production coordination; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, dispute, secured booking, closed, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Use a fine cinematic divider and a low-opacity status aura behind the record identity block. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create DP-08 — Stakeholder Profile Detail (viewing others) inside the established Director / Producer Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

DP-09 Shortlist Board

Pattern: List • Platform: Mobile + Web • Priority: P1

Purpose & scope: Contents: Kanban-style columns per requirement, candidate cards draggable, side-by-side compare view (rates, availability, ratings), team comments on candidates. Connects to: DP-10 (send request to one or multiple candidates), Casting Agency submissions can also land here.

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for project-led discovery, hiring, negotiation and production coordination; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for closed, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create DP-09 — Shortlist Board inside the established Director / Producer Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

DP-10 Booking Request Form (spine entry point)

Pattern: Workspace • Platform: Mobile + Web • Priority: P1

Purpose & scope: Contents: Structured offer: dates, fee offered, payment schedule builder (deposit % / milestones / final), deliverables, usage rights (for talent/model), special conditions, expiry timer for the offer, linked requirement + project auto-attached. Data: Creates booking with status Draft → Sent. Connects to: Stakeholder's Opportunity Inbox (their portal), DP-11 to track it.

Layout & components: Use a compact page header, status/context strip, structured content cards, and a clear primary action. Desktop uses a 12-column grid; mobile uses one-column progressive disclosure. Keep the most frequent action within one tap/click.

Functional contract: All tabs, CTAs, menus and linked records must operate on shared seeded data. Every primary action creates visible feedback and routes or mutates state; no placeholder button may remain inert. Use shared seeded repositories for project-led discovery, hiring, negotiation and production coordination; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, payment, secured booking, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Apply glass to the shell and command surfaces while keeping data-heavy content on readable near-opaque panels. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create DP-10 — Booking Request Form (spine entry point) inside the established Director / Producer Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

DP-11 Bargaining Center (List)

Pattern: List • Platform: Mobile + Web • Priority: P1

Purpose & scope: Contents: All negotiations across projects: status chips, latest round summary, expiry countdowns, "your move / their move" indicator, comparison view when multiple candidates negotiated for the same requirement. Connects to: DP-12.

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for project-led discovery, hiring, negotiation and production coordination; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create DP-11 — Bargaining Center (List) inside the established Director / Producer Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

DP-12 Negotiation Thread Detail (shared component with all stakeholder portals)

Pattern: Conversation • Platform: Mobile + Web • Priority: P1

Purpose & scope: Contents: Round-by-round timeline — each round is a structured card: rate, dates, payment schedule, conditions, message, timestamp, expiry. Actions: Accept / Counter / Ask question / Withdraw. Accept on both sides → terms lock → "Generate Contract" button appears. Connects to: SC-12 Contract Viewer (generation), SC-11 chat runs alongside, audit log records every round.

Layout & components: Use a contextual header, structured timeline/thread, and a compact composer. Keep booking/project status, counterparty identity, contract and payment shortcuts accessible without dominating the message area. Desktop may use an evidence/sidebar rail; mobile uses expandable context sheets.

Functional contract: Sending text or attachments, pinning decisions, masking contact details, opening linked records and reporting content must work. Seed realistic chronological messages and system events; include failed-send retry and restricted-contact states. Use shared seeded repositories for project-led discovery, hiring, negotiation and production coordination; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, contract, payment, secured booking, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Use neutral message bubbles with gold/cyan accents only for decisions, system events and action chips. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create DP-12 — Negotiation Thread Detail (shared component with all stakeholder portals) inside the established Director / Producer Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

DP-13 Contract Center (per project)

Pattern: Workspace • Platform: Mobile + Web • Priority: P1

Purpose & scope: Contents: All project contracts by status (pending signature / signed / addendums / cancelled), tap → SC-12. Document vault access with download. Connects to: SC-12, DP-14 (signed contract activates payment milestones).

Layout & components: Use a compact page header, status/context strip, structured content cards, and a clear primary action. Desktop uses a 12-column grid; mobile uses one-column progressive disclosure. Keep the most frequent action within one tap/click.

Functional contract: All tabs, CTAs, menus and linked records must operate on shared seeded data. Every primary action creates visible feedback and routes or mutates state; no placeholder button may remain inert. Use shared seeded repositories for project-led discovery, hiring, negotiation and production coordination; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for contract, payment, append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Apply glass to the shell and command surfaces while keeping data-heavy content on readable near-opaque panels. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create DP-13 — Contract Center (per project) inside the established Director / Producer Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

DP-14 Payment Center (per project)

Pattern: Money • Platform: Mobile + Web • Priority: P1

Purpose & scope: Contents: Milestone board per booking: what's due, what's uploaded, what's verified, what's rejected-with-reason. Upload proof button → SC-13. Receipts list → SC-14. Connects to: SC-13, SC-14, SA-07 (invisible to user but that's where proofs go).

Layout & components: Use money-safe hierarchy: totals and due items first, then milestone/status timeline, then ledger rows and receipts. Amount, currency, payer/payee, due date and verification status must never be visually ambiguous. Confirmation and destructive actions require explicit review modals.

Functional contract: Milestone actions, upload previews, verification outcomes, receipt opening, issue raising and ledger filtering must work. Simulate status transitions but never silently change an amount. Include pending, verified, rejected, partial, refunded and disputed examples. Use shared seeded repositories for project-led discovery, hiring, negotiation and production coordination; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Amounts use tabular numerals; warning and verification states override decorative accents. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create DP-14 — Payment Center (per project) inside the established Director / Producer Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

DP-15 Calendar & Schedule

Pattern: Calendar • Platform: Mobile + Web • Priority: P1

Purpose & scope: Contents: Month/week view aggregating: booked shoot days, call times, tentative holds, availability conflicts flagged red (double-booked actor across your own projects), pending confirmations. Connects to: Bookings, later AI Schedule Optimizer writes suggestions here.

Layout & components: Use month/week/day controls, a compact legend, timezone-aware date labels, conflict indicators and a selected-day agenda panel. Mobile defaults to agenda/week view with horizontal date strip. Tapping an event opens a bottom sheet or detail drawer rather than leaving the calendar unnecessarily.

Functional contract: Create, edit, hold, block or inspect events as allowed by the role. Conflicts and secured bookings update instantly; filters and view switches persist. Include empty week, conflict and fully booked states. Use shared seeded repositories for project-led discovery, hiring, negotiation and production coordination; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for secured booking, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use color plus pattern/icon indicators so status is not communicated by color alone. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create DP-15 — Calendar & Schedule inside the established Director / Producer Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

DP-16 Project Accounts / Budget

Pattern: Analytics • Platform: Mobile + Web • Priority: P1

Purpose & scope: Contents: Estimated budget vs confirmed booking cost vs paid vs pending, category-wise spending donut (talent/locations/equipment/crew), per-booking cost rows. Connects to: Reads contract values + verified ledger entries only (no manual numbers = trustworthy).

Layout & components: Use compact summary metrics, a filter/date bar, one primary chart at a time, supporting small charts, and a detailed table that explains the numbers. Charts must have legends, tooltips and accessible textual summaries. Exports and drill-downs must work in demo mode.

Functional contract: Date/category filters recompute seeded metrics, tooltips display values, table rows drill into source entities and export creates a local downloadable demo artifact or confirmation. Include insufficient-data and filtered-empty states. Use shared seeded repositories for project-led discovery, hiring, negotiation and production coordination; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for contract, payment, append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Charts use tokenized gold, cyan and violet accents on quiet surfaces; never use rainbow palettes. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create DP-16 — Project Accounts / Budget inside the established Director / Producer Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

DP-17 Project Room (Group Collaboration)

Pattern: Conversation • Platform: Mobile + Web • Priority: P1

Purpose & scope: Contents: Created after bookings are secured; director selects stakeholders to include. Group chat + files (scripts, mood boards, call sheets, costume refs), broadcast update composer (schedule change → push to selected members), pinned decisions. Connects to: SC-11 infrastructure reused in group mode; AI Call Sheet Generator posts here later.

Layout & components: Use a contextual header, structured timeline/thread, and a compact composer. Keep booking/project status, counterparty identity, contract and payment shortcuts accessible without dominating the message area. Desktop may use an evidence/sidebar rail; mobile uses expandable context sheets.

Functional contract: Sending text or attachments, pinning decisions, masking contact details, opening linked records and reporting content must work. Seed realistic chronological messages and system events; include failed-send retry and restricted-contact states. Use shared seeded repositories for project-led discovery, hiring, negotiation and production coordination; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for secured booking, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use neutral message bubbles with gold/cyan accents only for decisions, system events and action chips. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create DP-17 — Project Room (Group Collaboration) inside the established Director / Producer Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

DP-18 Reports & Export

Pattern: Analytics • Platform: Mobile + Web • Priority: P1

Purpose & scope: Contents: Per-project report builder: bookings summary, contracts list, payment records, pending actions, stakeholder performance. Export PDF/Excel. Connects to: Everything in the project; mirrors what SA-18 sees globally.

Layout & components: Use compact summary metrics, a filter/date bar, one primary chart at a time, supporting small charts, and a detailed table that explains the numbers. Charts must have legends, tooltips and accessible textual summaries. Exports and drill-downs must work in demo mode.

Functional contract: Date/category filters recompute seeded metrics, tooltips display values, table rows drill into source entities and export creates a local downloadable demo artifact or confirmation. Include insufficient-data and filtered-empty states. Use shared seeded repositories for project-led discovery, hiring, negotiation and production coordination; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for

contract, payment, dispute, closed, append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Charts use tokenized gold, cyan and violet accents on quiet surfaces; never use rainbow palettes. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create DP-18 — Reports & Export inside the established Director / Producer Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

11. Actor / Talent Portal

Platform: Mobile first | Build priority: P1

Portal shell: Compact bottom navigation: Home, Opportunities, Calendar, Earnings, Profile; contextual actions use sheets.

Design emphasis: This portal applies the shared cinematic holographic system to opportunity response, personal brand, availability, earnings and safety. Preserve compact hierarchy, shared status language and the same component geometry used in Admin Dashboard.

Screen count: 12 screens. Screen IDs are stable routing and QA identifiers and must appear in code comments, route definitions or test names.

PORTAL GENERATION PROMPT Build the complete Actor / Talent Portal (AT) with 12 screens. Use this shell: Compact bottom navigation: Home, Opportunities, Calendar, Earnings, Profile; contextual actions use sheets. Reuse the master design tokens and shared components. Optimize for opportunity response, personal brand, availability, earnings and safety. Implement every listed route, interaction and seeded state; maintain shared booking, negotiation, contract, payment and trust objects across portals.

AT-01 Talent Dashboard

Pattern: Dashboard • Platform: Mobile first • Priority: P1

Purpose & scope: Contents: Profile completeness meter (gamified — profiles under 80% get fewer matches), new opportunities count, pending actions (offers expiring, contracts to sign, payments to confirm), earnings summary, rating snapshot. Connects to: AT-06 inbox, SC-12, AT-10.

Layout & components: Use a compact command header, one horizontal KPI rail, a primary work canvas, and a narrower action-required rail. On mobile, convert the KPI rail to horizontally scrollable cards and place urgent tasks before analytics. Do not use oversized hero cards; information density and immediate action take priority.

Functional contract: Seed realistic cards, alerts and trends. KPI cards open filtered destinations; task rows can be completed or snoozed; carousels, tabs and quick actions must update local state. Include healthy, urgent and no-activity variants. Use shared seeded repositories for opportunity response, personal brand, availability, earnings and safety; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, contract, payment, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Use one restrained holographic focal glow behind the primary workload card; secondary cards remain neutral glass. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create AT-01 — Talent Dashboard inside the established Actor / Talent Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

AT-02 Profile Builder

Pattern: Form • Platform: Mobile first • Priority: P1

Purpose & scope: Contents: Stage name/real name, city, languages, skills tags, experience level, training/credits, agency affiliation (links to Casting Agency portal if roster-managed), verification badge state. Connects to: SA-04 moderation (edits re-reviewed), DP-06/08 (this is what directors see).

Layout & components: Use a focused stepper or sectioned form with a sticky progress/header region, compact labelled fields, contextual helper text, inline validation, and a live summary or preview panel on wide screens. Mobile uses one column and a sticky bottom action bar. Preserve entered values when navigating backward.

Functional contract: All fields validate, conditional sections appear when triggered, attachments show previews, draft data persists, submit changes the correct demo entity and routes to the next logical screen with a success toast. Include validation-error and partially completed states. Use shared seeded repositories for opportunity response, personal brand, availability, earnings and safety; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for verification, closed, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use luminous focus rings and a subtle progress gradient, not glowing every field. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create AT-02 — Profile Builder inside the established Actor / Talent Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

AT-03 Portfolio & Showreel Manager

Pattern: List • Platform: Mobile first • Priority: P1

Purpose & scope: Contents: Upload/manage: headshots, reels, drama clips, ads, theatre, voice samples, self-intro video. Ordering, cover selection, watermark applied to public previews automatically. Connects to: SA-04 moderation queue before public visibility.

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for opportunity response, personal brand, availability, earnings and safety; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for verification, closed, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create AT-03 — Portfolio & Showreel Manager inside the established Actor / Talent Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

AT-04 Availability Calendar (own)

Pattern: Calendar • Platform: Mobile first • Priority: P1

Purpose & scope: Contents: Mark dates: available / booked / tentative / unavailable; preferred cities; travel limits. Secured bookings auto-block dates. Connects to: DP-06 filters and DP-15 conflicts read this; booking engine writes to it.

Layout & components: Use month/week/day controls, a compact legend, timezone-aware date labels, conflict indicators and a selected-day agenda panel. Mobile defaults to agenda/week view with horizontal date strip. Tapping an event opens a bottom sheet or detail drawer rather than leaving the calendar unnecessarily.

Functional contract: Create, edit, hold, block or inspect events as allowed by the role. Conflicts and secured bookings update instantly; filters and view switches persist. Include empty week, conflict and fully booked states. Use shared seeded repositories for opportunity response, personal brand, availability, earnings and safety; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for dispute, secured booking, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use color plus pattern/icon indicators so status is not communicated by color alone. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create AT-04 — Availability Calendar (own) inside the established Actor / Talent Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

AT-05 Rate Card

Pattern: Settings • Platform: Mobile first • Priority: P1

Purpose & scope: Contents: Per day / per project / per episode / rehearsal / overtime / travel day / special usage rates. "Negotiable" toggles. Connects to: Displayed on DP-08; pre-fills negotiation rounds.

Layout & components: Use categorized settings cards with concise labels, current values and immediate feedback. Avoid long undifferentiated forms. Sensitive changes require OTP/re-authentication simulation and confirmation. Changes must update the visible app immediately and persist locally.

Functional contract: Toggles, selectors and save actions apply immediately, persist in local storage and trigger any necessary confirmation simulation. Include permission denied, re-authentication and reset-to-default behavior. Use shared seeded repositories for opportunity response, personal brand, availability, earnings and safety; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Use clean grouped surfaces and restrained accent indicators. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create AT-05 — Rate Card inside the established Actor / Talent Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

AT-06 Opportunity Inbox

Pattern: List • Platform: Mobile first • Priority: P1

Purpose & scope: Contents: Tabs — Direct Offers / Audition Invites / Casting Calls. Offer cards show project type, dates, fee, director rating, expiry countdown. Sort by expiry. Connects to: AT-07.

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for opportunity response, personal brand, availability, earnings and safety; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create AT-06 — Opportunity Inbox inside the established Actor / Talent Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

AT-07 Offer Detail & Response

Pattern: Detail • Platform: Mobile first • Priority: P1

Purpose & scope: Contents: Full structured offer (mirror of DP-10), actions: Accept / Reject with reason / Ask question / Hold dates tentatively / Counteroffer → opens AT-08. Connects to: DP-12's shared negotiation thread (same component, stakeholder view).

Layout & components: Use a two-column evidence/workspace layout on desktop: the primary content canvas and a sticky action/summary rail. Mobile collapses into ordered sections with critical actions in a persistent bottom bar. Keep identifiers, status, ownership and timestamps visible at the top.

Functional contract: Actions must mutate the shared demo object, append an audit/timeline event, show confirmation feedback and update upstream lists. Include normal, action-required, read-only, blocked and completed states where relevant. Use shared seeded repositories for opportunity response, personal brand, availability, earnings and safety; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Use a fine cinematic divider and a low-opacity status aura behind the record identity block. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create AT-07 — Offer Detail & Response inside the established Actor / Talent Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

AT-08 Counteroffer Composer

Pattern: Form • Platform: Mobile first • Priority: P1

Purpose & scope: Contents: Editable copy of terms: counter amount, change dates, request advance %, add conditions (travel provided, wardrobe, usage limits), message. Later: AI Negotiation Assistant suggests professional wording here. Connects to: Negotiation round created → director's DP-11.

Layout & components: Use a focused stepper or sectioned form with a sticky progress/header region, compact labelled fields, contextual helper text, inline validation, and a live summary or preview panel on wide screens. Mobile uses one column and a sticky bottom action bar. Preserve entered values when navigating backward.

Functional contract: All fields validate, conditional sections appear when triggered, attachments show previews, draft data persists, submit changes the correct demo entity and routes to the next logical screen with a success toast. Include validation-error and partially completed states. Use shared seeded repositories for opportunity response, personal brand, availability, earnings and safety; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Use luminous focus rings and a subtle progress gradient, not glowing every field. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create AT-08 — Counteroffer Composer inside the established Actor / Talent Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

AT-09 Contract Signing (uses SC-12)

Pattern: Detail • Platform: Mobile first • Priority: P1

Purpose & scope: Contents: SC-12 in stakeholder mode + "Request correction" routes back to negotiation.

Layout & components: Use a two-column evidence/workspace layout on desktop: the primary content canvas and a sticky action/summary rail. Mobile collapses into ordered sections with critical actions in a persistent bottom bar. Keep identifiers, status, ownership and timestamps visible at the top.

Functional contract: Actions must mutate the shared demo object, append an audit/timeline event, show confirmation feedback and update upstream lists. Include normal, action-required, read-only, blocked and completed states where relevant. Use shared seeded repositories for opportunity response, personal brand, availability, earnings and safety; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, contract, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Use a fine cinematic divider and a low-opacity status aura behind the record identity block. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create AT-09 — Contract Signing (uses SC-12) inside the established Actor / Talent Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

AT-10 Earnings & Payment Security

Pattern: Money • Platform: Mobile first • Priority: P1

Purpose & scope: Contents: Per-booking payment status timeline (pending → under verification → verified → released), confirm-receipt action ("I received this payment" — the stakeholder confirmation the closure check needs), raise payment issue → dispute flow, total earnings, receipts (SC-14). Connects to: SA-07/08 outcomes, dispute center.

Layout & components: Use money-safe hierarchy: totals and due items first, then milestone/status timeline, then ledger rows and receipts. Amount, currency, payer/payee, due date and verification status must never be visually ambiguous. Confirmation and destructive actions require explicit review modals.

Functional contract: Milestone actions, upload previews, verification outcomes, receipt opening, issue raising and ledger filtering must work. Simulate status transitions but never silently change an amount. Include pending, verified, rejected, partial, refunded and disputed examples. Use shared seeded repositories for opportunity response, personal brand, availability, earnings and safety; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, verification, dispute, append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Amounts use tabular numerals; warning and verification states override decorative accents. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create AT-10 — Earnings & Payment Security inside the established Actor / Talent Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

AT-11 Reputation & Reviews

Pattern: Workspace • Platform: Mobile first • Priority: P1

Purpose & scope: Contents: Rating breakdown (punctuality, response time, professionalism), director reviews, trust badges earned, repeat-booking score, tips to improve. Connects to: SC-15 output; displayed on DP-08.

Layout & components: Use a compact page header, status/context strip, structured content cards, and a clear primary action. Desktop uses a 12-column grid; mobile uses one-column progressive disclosure. Keep the most frequent action within one tap/click.

Functional contract: All tabs, CTAs, menus and linked records must operate on shared seeded data. Every primary action creates visible feedback and routes or mutates state; no placeholder button may remain inert. Use shared seeded repositories for opportunity response, personal brand, availability, earnings and safety; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for closed, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Apply glass to the shell and command surfaces while keeping data-heavy content on readable near-opaque panels. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create AT-11 — Reputation & Reviews inside the established Actor / Talent Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

AT-12 Safety Controls

Pattern: Settings • Platform: Mobile first • Priority: P1

Purpose & scope: Contents: Report suspicious offer shortcut, blocked users list, phone-number-hidden status indicator, brand/content boundaries (fed further by Model extension), emergency support contact during active shoot days. Connects to: SC-16, SA-15.

Layout & components: Use categorized settings cards with concise labels, current values and immediate feedback. Avoid long undifferentiated forms. Sensitive changes require OTP/re-authentication simulation and confirmation. Changes must update the visible app immediately and persist locally.

Functional contract: Toggles, selectors and save actions apply immediately, persist in local storage and trigger any necessary confirmation simulation. Include permission denied, re-authentication and reset-to-default behavior. Use shared seeded repositories for opportunity response, personal brand, availability, earnings and safety; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, dispute, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Use clean grouped surfaces and restrained accent indicators. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create AT-12 — Safety Controls inside the established Actor / Talent Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

12. Model Extension

Platform: Mobile | Build priority: P2

Portal shell: Extends Actor shell; Model-specific items appear inside Profile, Rates, Portfolio and Safety.

Design emphasis: This portal applies the shared cinematic holographic system to usage rights, campaign fit, brand boundaries and specialized pricing. Preserve compact hierarchy, shared status language and the same component geometry used in Admin Dashboard.

Screen count: 5 screens. Screen IDs are stable routing and QA identifiers and must appear in code comments, route definitions or test names.

PORTAL GENERATION PROMPT Build the complete Model Extension (MD) with 5 screens. Use this shell: Extends Actor shell; Model-specific items appear inside Profile, Rates, Portfolio and Safety. Reuse the master design tokens and shared components. Optimize for usage rights, campaign fit, brand boundaries and specialized pricing. Implement every listed route, interaction and seeded state; maintain shared booking, negotiation, contract, payment and trust objects across portals.

MD-01 Campaign Categories Setup

Pattern: Form • Platform: Mobile • Priority: P2

Purpose & scope: Fashion, beauty, commercial, lifestyle, bridal, product, fitness, ecommerce, billboard, print, social media, TVC — multi-select with per-category visibility.

Layout & components: Use a focused stepper or sectioned form with a sticky progress/header region, compact labelled fields, contextual helper text, inline validation, and a live summary or preview panel on wide screens. Mobile uses one column and a sticky bottom action bar. Preserve entered values when navigating backward.

Functional contract: All fields validate, conditional sections appear when triggered, attachments show previews, draft data persists, submit changes the correct demo entity and routes to the next logical screen with a success toast. Include validation-error and partially completed states. Use shared seeded repositories for usage rights, campaign fit, brand boundaries and specialized pricing; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use luminous focus rings and a subtle progress gradient, not glowing every field. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create MD-01 — Campaign Categories Setup inside the established Model Extension shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

MD-02 Usage Rights Manager (the model-industry differentiator)

Pattern: List • Platform: Mobile • Priority: P2

Purpose & scope: Contents: Define allowed usage per booking: platform (Instagram/website/print/billboard/TV/packaging), territory, duration, exclusivity. These fields become MANDATORY blocks in any model contract (enforced by SA-09 template rules). Connects to: DP-10 model offers must specify usage; SC-12 model release renders it.

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for usage rights, campaign fit, brand boundaries and specialized pricing; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, contract, dispute, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create MD-02 — Usage Rights Manager (the model-industry differentiator) inside the established Model Extension shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

MD-03 Portfolio Categories

Pattern: Profile • Platform: Mobile • Priority: P2

Purpose & scope: Headshots, full-length, editorial, commercial, ramp, ethnic wear, western wear, makeup looks, product shoots — extends AT-03 with category tabs.

Layout & components: Use a restrained cinematic identity header, trust badges, compact biography/metadata, and tabbed portfolio or operational sections. Media grids should prioritize aspect-ratio consistency, watermarked previews and fast filters. Editing uses a sheet or dedicated form without changing the public-view hierarchy.

Functional contract: Edit, reorder, filter, publish/unpublish and preview actions must work according to role. Media upload creates a local preview and moderation state. Trust/status elements must be driven by seeded data, not hard-coded

decoration. Use shared seeded repositories for usage rights, campaign fit, brand boundaries and specialized pricing; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Media is the visual focus; UI chrome remains compact, translucent and secondary. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create MD-03 — Portfolio Categories inside the established Model Extension shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

MD-04 Rate by Usage

Pattern: Settings • Platform: Mobile • Priority: P2

Purpose & scope: Separate rate rows: one-day shoot, social media usage, billboard, TVC, exclusive brand use, long-term campaign. Extends AT-05.

Layout & components: Use categorized settings cards with concise labels, current values and immediate feedback. Avoid long undifferentiated forms. Sensitive changes require OTP/re-authentication simulation and confirmation. Changes must update the visible app immediately and persist locally.

Functional contract: Toggles, selectors and save actions apply immediately, persist in local storage and trigger any necessary confirmation simulation. Include permission denied, re-authentication and reset-to-default behavior. Use shared seeded repositories for usage rights, campaign fit, brand boundaries and specialized pricing; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use clean grouped surfaces and restrained accent indicators. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create MD-04 — Rate by Usage inside the established Model Extension shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

MD-05 Brand Safety Preferences

Pattern: Settings • Platform: Mobile • Priority: P2

Purpose & scope: Restricted categories list, "require my review" toggle for sensitive campaigns; offers violating preferences are auto-flagged before reaching the inbox.

Layout & components: Use categorized settings cards with concise labels, current values and immediate feedback. Avoid long undifferentiated forms. Sensitive changes require OTP/re-authentication simulation and confirmation. Changes must update the visible app immediately and persist locally.

Functional contract: Toggles, selectors and save actions apply immediately, persist in local storage and trigger any necessary confirmation simulation. Include permission denied, re-authentication and reset-to-default behavior. Use shared seeded repositories for usage rights, campaign fit, brand boundaries and specialized pricing; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, closed, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Use clean grouped surfaces and restrained accent indicators. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create MD-05 — Brand Safety Preferences inside the established Model Extension shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

13. Location Owner Portal

Platform: Mobile first | **Build priority:** P2

Portal shell: Bottom navigation: Home, Properties, Requests, Calendar, Earnings; active property switcher in top bar.

Design emphasis: This portal applies the shared cinematic holographic system to property listing, shoot operations, inspections, deposits and performance. Preserve compact hierarchy, shared status language and the same component geometry used in Admin Dashboard.

Screen count: 10 screens. Screen IDs are stable routing and QA identifiers and must appear in code comments, route definitions or test names.

PORTAL GENERATION PROMPT Build the complete Location Owner Portal (LO) with 10 screens. Use this shell: Bottom navigation: Home, Properties, Requests, Calendar, Earnings; active property switcher in top bar. Reuse the master design tokens and shared components. Optimize for property listing, shoot operations, inspections, deposits and performance. Implement every listed route, interaction and seeded state; maintain shared booking, negotiation, contract, payment and trust objects across portals.

LO-01 Owner Dashboard

Pattern: Dashboard • Platform: Mobile first • Priority: P2

Purpose & scope: Upcoming shoots, pending requests, earnings, ratings, property performance, dispute history.

Layout & components: Use a compact command header, one horizontal KPI rail, a primary work canvas, and a narrower action-required rail. On mobile, convert the KPI rail to horizontally scrollable cards and place urgent tasks before analytics. Do not use oversized hero cards; information density and immediate action take priority.

Functional contract: Seed realistic cards, alerts and trends. KPI cards open filtered destinations; task rows can be completed or snoozed; carousels, tabs and quick actions must update local state. Include healthy, urgent and no-activity variants. Use shared seeded repositories for property listing, shoot operations, inspections, deposits and performance; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, dispute, closed, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Use one restrained holographic focal glow behind the primary workload card; secondary cards remain neutral glass. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create LO-01 — Owner Dashboard inside the established Location Owner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

LO-02 Location Listing Wizard

Pattern: Form • Platform: Mobile first • Priority: P2

Purpose & scope: Steps: property type (home/studio/office/farm/restaurant/rooftop/other) → photos & video → city + area (EXACT ADDRESS field stored encrypted, public view shows approximate area only) → available areas, capacity, parking, power backup, accessibility. Connects to: SA-05 moderation before going live; DP-06 Locations tab.

Layout & components: Use a focused stepper or sectioned form with a sticky progress/header region, compact labelled fields, contextual helper text, inline validation, and a live summary or preview panel on wide screens. Mobile uses one column and a sticky bottom action bar. Preserve entered values when navigating backward.

Functional contract: All fields validate, conditional sections appear when triggered, attachments show previews, draft data persists, submit changes the correct demo entity and routes to the next logical screen with a success toast. Include validation-error and partially completed states. Use shared seeded repositories for property listing, shoot operations, inspections, deposits and performance; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for verification, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use luminous focus rings and a subtle progress gradient, not glowing every field. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create LO-02 — Location Listing Wizard inside the established Location Owner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

LO-03 Availability Calendar

Pattern: Calendar • Platform: Mobile first • Priority: P2

Purpose & scope: Available / blocked / maintenance / tentative-hold dates. Secured bookings auto-block.

Layout & components: Use month/week/day controls, a compact legend, timezone-aware date labels, conflict indicators and a selected-day agenda panel. Mobile defaults to agenda/week view with horizontal date strip. Tapping an event opens a bottom sheet or detail drawer rather than leaving the calendar unnecessarily.

Functional contract: Create, edit, hold, block or inspect events as allowed by the role. Conflicts and secured bookings update instantly; filters and view switches persist. Include empty week, conflict and fully booked states. Use shared seeded repositories for property listing, shoot operations, inspections, deposits and performance; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for dispute, secured

booking, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use color plus pattern/icon indicators so status is not communicated by color alone. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create LO-03 — Availability Calendar inside the established Location Owner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

LO-04 Pricing & Deposit Setup

Pattern: Money • Platform: Mobile first • Priority: P2

Purpose & scope: Hourly, half-day, full-day, night shoot, overtime rate, cleaning fee, security deposit amount.

Layout & components: Use money-safe hierarchy: totals and due items first, then milestone/status timeline, then ledger rows and receipts. Amount, currency, payer/payee, due date and verification status must never be visually ambiguous. Confirmation and destructive actions require explicit review modals.

Functional contract: Milestone actions, upload previews, verification outcomes, receipt opening, issue raising and ledger filtering must work. Simulate status transitions but never silently change an amount. Include pending, verified, rejected, partial, refunded and disputed examples. Use shared seeded repositories for property listing, shoot operations, inspections, deposits and performance; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Amounts use tabular numerals; warning and verification states override decorative accents. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create LO-04 — Pricing & Deposit Setup inside the established Location Owner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

LO-05 Rules & Restrictions

Pattern: Settings • Platform: Mobile first • Priority: P2

Purpose & scope: Toggles + notes: smoking, pets, loud sound, heavy equipment, kitchen use, bedroom access, rooftop access, max crew size. These render on the public listing AND auto-insert into the location contract.

Layout & components: Use categorized settings cards with concise labels, current values and immediate feedback. Avoid long undifferentiated forms. Sensitive changes require OTP/re-authentication simulation and confirmation. Changes must update the visible app immediately and persist locally.

Functional contract: Toggles, selectors and save actions apply immediately, persist in local storage and trigger any necessary confirmation simulation. Include permission denied, re-authentication and reset-to-default behavior. Use shared seeded repositories for property listing, shoot operations, inspections, deposits and performance; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for contract, append a timeline/audit event and refresh connected counters. Notify unsigned parties, project owner and the contract center; append an immutable timeline event.

Visual / responsive direction: Use clean grouped surfaces and restrained accent indicators. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create LO-05 — Rules & Restrictions inside the established Location Owner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

LO-06 Booking Requests Inbox

Pattern: List • Platform: Mobile first • Priority: P2

Purpose & scope: Mirror of AT-06 for location requests → shared negotiation thread → location contract via SC-12.

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for property listing, shoot operations, inspections, deposits and performance; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, contract, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create LO-06 — Booking Requests Inbox inside the established Location Owner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

LO-07 Check-In Inspection Screen

Pattern: Inspection • Platform: Mobile first • Priority: P2

Purpose & scope: Contents: Guided checklist on shoot day: before-photos per room/area, meter readings, furniture condition notes, crew-size confirmation, both-party digital handover confirmation. Connects to: Evidence store → SA-12 damage disputes; deposit release logic.

Layout & components: Use a guided operational checklist with progress, required evidence capture, serial/room identifiers, before/after comparison, signatures and a final review step. Prevent completion when mandatory evidence is missing. Support draft saving and clear offline-safe states.

Functional contract: Checklist completion, image placeholders/previews, notes, confirmations, comparison and claim creation must work. Evidence remains attached to the correct booking/item/property and appears in the dispute demo data. Use shared seeded repositories for property listing, shoot operations, inspections, deposits and performance; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, dispute, secured booking, append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Prioritize evidence clarity over decoration; use holographic treatment only on progress and confirmed matches. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create LO-07 — Check-In Inspection Screen inside the established Location Owner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

LO-08 Check-Out & Damage Claim Screen

Pattern: Inspection • Platform: Mobile first • Priority: P2

Purpose & scope: After-photos, condition comparison side-by-side with check-in, "all clear → release deposit" or "file damage claim" (amount + evidence → admin review, deposit adjustment record generated).

Layout & components: Use a guided operational checklist with progress, required evidence capture, serial/room identifiers, before/after comparison, signatures and a final review step. Prevent completion when mandatory evidence is missing. Support draft saving and clear offline-safe states.

Functional contract: Checklist completion, image placeholders/previews, notes, confirmations, comparison and claim creation must work. Evidence remains attached to the correct booking/item/property and appears in the dispute demo data. Use shared seeded repositories for property listing, shoot operations, inspections, deposits and performance; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, dispute, secured booking, closed, append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Prioritize evidence clarity over decoration; use holographic treatment only on progress and confirmed matches. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create LO-08 — Check-Out & Damage Claim Screen inside the established Location Owner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

LO-09 Earnings & Deposits

Pattern: Money • Platform: Mobile first • Priority: P2

Purpose & scope: Rental income ledger, deposits held / released / claimed, receipts.

Layout & components: Use money-safe hierarchy: totals and due items first, then milestone/status timeline, then ledger rows and receipts. Amount, currency, payer/payee, due date and verification status must never be visually ambiguous. Confirmation and destructive actions require explicit review modals.

Functional contract: Milestone actions, upload previews, verification outcomes, receipt opening, issue raising and ledger filtering must work. Simulate status transitions but never silently change an amount. Include pending, verified, rejected, partial, refunded and disputed examples. Use shared seeded repositories for property listing, shoot operations, inspections, deposits and performance; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, dispute, append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Amounts use tabular numerals; warning and verification states override decorative accents. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create LO-09 — Earnings & Deposits inside the established Location Owner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

LO-10 Property Performance

Pattern: Analytics • Platform: Mobile first • Priority: P2

Purpose & scope: Views, request rate, booking conversion, rating per property, suggestions (add night-shoot pricing, better photos).

Layout & components: Use compact summary metrics, a filter/date bar, one primary chart at a time, supporting small charts, and a detailed table that explains the numbers. Charts must have legends, tooltips and accessible textual summaries. Exports and drill-downs must work in demo mode.

Functional contract: Date/category filters recompute seeded metrics, tooltips display values, table rows drill into source entities and export creates a local downloadable demo artifact or confirmation. Include insufficient-data and filtered-empty states. Use shared seeded repositories for property listing, shoot operations, inspections, deposits and performance; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for closed, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Charts use tokenized gold, cyan and violet accents on quiet surfaces; never use rainbow palettes. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create LO-10 — Property Performance inside the established Location Owner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

14. Media / Equipment Provider Portal

Platform: Mobile first | Build priority: P2

Portal shell: Bottom navigation: Home, Inventory, Requests, Schedule, Earnings; inventory context on operational screens.

Design emphasis: This portal applies the shared cinematic holographic system to inventory, packages, logistics, handover, return and utilization. Preserve compact hierarchy, shared status language and the same component geometry used in Admin Dashboard.

Screen count: 10 screens. Screen IDs are stable routing and QA identifiers and must appear in code comments, route definitions or test names.

PORTAL GENERATION PROMPT Build the complete Media / Equipment Provider Portal (ME) with 10 screens. Use this shell: Bottom navigation: Home, Inventory, Requests, Schedule, Earnings; inventory context on operational screens. Reuse the master design tokens and shared components. Optimize for inventory, packages, logistics, handover, return and utilization. Implement every listed route, interaction and seeded state; maintain shared booking, negotiation, contract, payment and trust objects across portals.

ME-01 Provider Dashboard

Pattern: Dashboard • Platform: Mobile first • Priority: P2

Purpose & scope: Bookings today (pickups/returns highlighted), pending requests, utilization %, earnings, ratings.

Layout & components: Use a compact command header, one horizontal KPI rail, a primary work canvas, and a narrower action-required rail. On mobile, convert the KPI rail to horizontally scrollable cards and place urgent tasks before analytics. Do not use oversized hero cards; information density and immediate action take priority.

Functional contract: Seed realistic cards, alerts and trends. KPI cards open filtered destinations; task rows can be completed or snoozed; carousels, tabs and quick actions must update local state. Include healthy, urgent and no-activity variants. Use shared seeded repositories for inventory, packages, logistics, handover, return and utilization; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, closed, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Use one restrained holographic focal glow behind the primary workload card; secondary cards remain neutral glass. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create ME-01 — Provider Dashboard inside the established Media / Equipment Provider Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

ME-02 Provider Profile

Pattern: Profile • Platform: Mobile first • Priority: P2

Purpose & scope: Business/individual, city + coverage areas, verification, service categories, portfolio of past productions.

Layout & components: Use a restrained cinematic identity header, trust badges, compact biography/metadata, and tabbed portfolio or operational sections. Media grids should prioritize aspect-ratio consistency, watermarked previews and fast filters. Editing uses a sheet or dedicated form without changing the public-view hierarchy.

Functional contract: Edit, reorder, filter, publish/unpublish and preview actions must work according to role. Media upload creates a local preview and moderation state. Trust/status elements must be driven by seeded data, not hard-coded decoration. Use shared seeded repositories for inventory, packages, logistics, handover, return and utilization; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for verification, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Media is the visual focus; UI chrome remains compact, translucent and secondary. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create ME-02 — Provider Profile inside the established Media / Equipment Provider Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

ME-03 Inventory Manager

Pattern: List • Platform: Mobile first • Priority: P2

Purpose & scope: Contents: Item CRUD: category (camera/lens/light/gimbal/drone/mic/audio kit/monitor/van/generator/studio), model name, serial number (critical for handover proof), condition photos, per-item day rate, deposit required. Connects to: ME-04 packages pull from inventory; ME-08 handover checklist reads serials.

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for inventory, packages, logistics, handover, return and utilization; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, secured booking,

append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create ME-03 — Inventory Manager inside the established Media / Equipment Provider Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

ME-04 Package Builder

Pattern: Form • Platform: Mobile first • Priority: P2

Purpose & scope: Bundle inventory + services: "Basic Shoot Package," "Premium Camera Crew," "Drone Package," "Editing Package," "Full Media Team." Package = items + operators included + price + terms.

Layout & components: Use a focused stepper or sectioned form with a sticky progress/header region, compact labelled fields, contextual helper text, inline validation, and a live summary or preview panel on wide screens. Mobile uses one column and a sticky bottom action bar. Preserve entered values when navigating backward.

Functional contract: All fields validate, conditional sections appear when triggered, attachments show previews, draft data persists, submit changes the correct demo entity and routes to the next logical screen with a success toast. Include validation-error and partially completed states. Use shared seeded repositories for inventory, packages, logistics, handover, return and utilization; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use luminous focus rings and a subtle progress gradient, not glowing every field. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create ME-04 — Package Builder inside the established Media / Equipment Provider Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

ME-05 Availability Calendar

Pattern: Calendar • Platform: Mobile first • Priority: P2

Purpose & scope: Per-item AND per-team availability by date and city; conflicts blocked automatically.

Layout & components: Use month/week/day controls, a compact legend, timezone-aware date labels, conflict indicators and a selected-day agenda panel. Mobile defaults to agenda/week view with horizontal date strip. Tapping an event opens a bottom sheet or detail drawer rather than leaving the calendar unnecessarily.

Functional contract: Create, edit, hold, block or inspect events as allowed by the role. Conflicts and secured bookings update instantly; filters and view switches persist. Include empty week, conflict and fully booked states. Use shared seeded repositories for inventory, packages, logistics, handover, return and utilization; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for dispute, secured booking, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use color plus pattern/icon indicators so status is not communicated by color alone. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create ME-05 — Availability Calendar inside the established Media / Equipment Provider Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

ME-06 Rate & Terms Management

Pattern: Settings • Platform: Mobile first • Priority: P2

Purpose & scope: Hourly/daily/weekly/project rates, operator included/extra, assistant, transport, overtime, deposit; booking rules: damage responsibility, pickup/drop, fuel, weather clause, cancellation terms.

Layout & components: Use categorized settings cards with concise labels, current values and immediate feedback. Avoid long undifferentiated forms. Sensitive changes require OTP/re-authentication simulation and confirmation. Changes must update the visible app immediately and persist locally.

Functional contract: Toggles, selectors and save actions apply immediately, persist in local storage and trigger any necessary confirmation simulation. Include permission denied, re-authentication and reset-to-default behavior. Use shared seeded repositories for inventory, packages, logistics, handover, return and utilization; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Use clean grouped surfaces and restrained accent indicators. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create ME-06 — Rate & Terms Management inside the established Media / Equipment Provider Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

ME-07 Booking Requests & Negotiation

Pattern: Workspace • Platform: Mobile first • Priority: P2

Purpose & scope: Shared inbox + negotiation components → equipment rental contract listing exact items + serials.

Layout & components: Use a compact page header, status/context strip, structured content cards, and a clear primary action. Desktop uses a 12-column grid; mobile uses one-column progressive disclosure. Keep the most frequent action within one tap/click.

Functional contract: All tabs, CTAs, menus and linked records must operate on shared seeded data. Every primary action creates visible feedback and routes or mutates state; no placeholder button may remain inert. Use shared seeded repositories for inventory, packages, logistics, handover, return and utilization; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, contract, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Apply glass to the shell and command surfaces while keeping data-heavy content on readable near-opaque panels. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create ME-07 — Booking Requests & Negotiation inside the established Media / Equipment Provider Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

ME-08 Handover Checklist

Pattern: Inspection • Platform: Mobile first • Priority: P2

Purpose & scope: Delivery: photos of each item, serial verification scan/tick, accessories list, both-party confirmation. Mirrors LO-07 pattern.

Layout & components: Use a guided operational checklist with progress, required evidence capture, serial/room identifiers, before/after comparison, signatures and a final review step. Prevent completion when mandatory evidence is missing. Support draft saving and clear offline-safe states.

Functional contract: Checklist completion, image placeholders/previews, notes, confirmations, comparison and claim creation must work. Evidence remains attached to the correct booking/item/property and appears in the dispute demo data. Use shared seeded repositories for inventory, packages, logistics, handover, return and utilization; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for verification, secured booking, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Prioritize evidence clarity over decoration; use holographic treatment only on progress and confirmed matches. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create ME-08 — Handover Checklist inside the established Media / Equipment Provider Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

ME-09 Return Checklist

Pattern: Inspection • Platform: Mobile first • Priority: P2

Purpose & scope: Condition comparison, missing/damage flags → deposit claim path → admin. Mirrors LO-08.

Layout & components: Use a guided operational checklist with progress, required evidence capture, serial/room identifiers, before/after comparison, signatures and a final review step. Prevent completion when mandatory evidence is missing. Support draft saving and clear offline-safe states.

Functional contract: Checklist completion, image placeholders/previews, notes, confirmations, comparison and claim creation must work. Evidence remains attached to the correct booking/item/property and appears in the dispute demo data. Use shared seeded repositories for inventory, packages, logistics, handover, return and utilization; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, dispute, append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Prioritize evidence clarity over decoration; use holographic treatment only on progress and confirmed matches. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create ME-09 — Return Checklist inside the established Media / Equipment Provider Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

ME-10 Earnings & Ratings

Pattern: Money • Platform: Mobile first • Priority: P2

Purpose & scope: Revenue by item/package, utilization report, quality/punctuality/equipment-condition ratings, dispute count.

Layout & components: Use money-safe hierarchy: totals and due items first, then milestone/status timeline, then ledger rows and receipts. Amount, currency, payer/payee, due date and verification status must never be visually ambiguous. Confirmation and destructive actions require explicit review modals.

Functional contract: Milestone actions, upload previews, verification outcomes, receipt opening, issue raising and ledger filtering must work. Simulate status transitions but never silently change an amount. Include pending, verified, rejected, partial, refunded and disputed examples. Use shared seeded repositories for inventory, packages, logistics, handover, return and utilization; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, dispute, closed, append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Amounts use tabular numerals; warning and verification states override decorative accents. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create ME-10 — Earnings & Ratings inside the established Media / Equipment Provider Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

15. Crew & Production Services Portal

Platform: Mobile | Build priority: P3

Portal shell: Actor-shell reuse with service labels: Home, Requests, Calendar, Payments, Profile.

Design emphasis: This portal applies the shared cinematic holographic system to service profile, job requests, availability, contracts and reputation. Preserve compact hierarchy, shared status language and the same component geometry used in Admin Dashboard.

Screen count: 7 screens. Screen IDs are stable routing and QA identifiers and must appear in code comments, route definitions or test names.

PORTAL GENERATION PROMPT Build the complete Crew & Production Services Portal (CR) with 7 screens. Use this shell: Actor-shell reuse with service labels: Home, Requests, Calendar, Payments, Profile. Reuse the master design tokens and shared components. Optimize for service profile, job requests, availability, contracts and reputation. Implement every listed route, interaction and seeded state; maintain shared booking, negotiation, contract, payment and trust objects across portals.

CR-01 Crew Dashboard

Pattern: Dashboard • Platform: Mobile • Priority: P3

Purpose & scope: Dashboard showing new service requests, confirmed jobs, pending contracts, earnings, profile completeness, and the next scheduled production day.

Layout & components: Use a compact command header, one horizontal KPI rail, a primary work canvas, and a narrower action-required rail. On mobile, convert the KPI rail to horizontally scrollable cards and place urgent tasks before analytics. Do not use oversized hero cards; information density and immediate action take priority.

Functional contract: Seed realistic cards, alerts and trends. KPI cards open filtered destinations; task rows can be completed or snoozed; carousels, tabs and quick actions must update local state. Include healthy, urgent and no-activity variants. Use shared seeded repositories for service profile, job requests, availability, contracts and reputation; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for contract, payment, secured booking, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Use one restrained holographic focal glow behind the primary workload card; secondary cards remain neutral glass. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create CR-01 — Crew Dashboard inside the established Crew & Production Services Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

CR-02 Service Profile

Pattern: Profile • Platform: Mobile • Priority: P3

Purpose & scope: Profile setup for DOP, assistant director, makeup, stylist, art director, editor, sound engineer, choreographer, writer, transport, catering and other services; includes owned kit, experience and day rate.

Layout & components: Use a restrained cinematic identity header, trust badges, compact biography/metadata, and tabbed portfolio or operational sections. Media grids should prioritize aspect-ratio consistency, watermarked previews and fast filters. Editing uses a sheet or dedicated form without changing the public-view hierarchy.

Functional contract: Edit, reorder, filter, publish/unpublish and preview actions must work according to role. Media upload creates a local preview and moderation state. Trust/status elements must be driven by seeded data, not hard-coded decoration. Use shared seeded repositories for service profile, job requests, availability, contracts and reputation; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Media is the visual focus; UI chrome remains compact, translucent and secondary. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create CR-02 — Service Profile inside the established Crew & Production Services Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

CR-03 Portfolio & Credits

Pattern: Profile • Platform: Mobile • Priority: P3

Purpose & scope: Past-work credits, reels, stills, references, production categories, role-specific proof and ordering of featured work.

Layout & components: Use a restrained cinematic identity header, trust badges, compact biography/metadata, and tabbed portfolio or operational sections. Media grids should prioritize aspect-ratio consistency, watermarked previews and fast filters. Editing uses a sheet or dedicated form without changing the public-view hierarchy.

Functional contract: Edit, reorder, filter, publish/unpublish and preview actions must work according to role. Media upload creates a local preview and moderation state. Trust/status elements must be driven by seeded data, not hard-coded decoration. Use shared seeded repositories for service profile, job requests, availability, contracts and reputation; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Media is the visual focus; UI chrome remains compact, translucent and secondary. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create CR-03 — Portfolio & Credits inside the established Crew & Production Services Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

CR-04 Availability Calendar

Pattern: Calendar • Platform: Mobile • Priority: P3

Purpose & scope: Reusable availability calendar with available, unavailable, tentative and booked states; secured bookings block time automatically.

Layout & components: Use month/week/day controls, a compact legend, timezone-aware date labels, conflict indicators and a selected-day agenda panel. Mobile defaults to agenda/week view with horizontal date strip. Tapping an event opens a bottom sheet or detail drawer rather than leaving the calendar unnecessarily.

Functional contract: Create, edit, hold, block or inspect events as allowed by the role. Conflicts and secured bookings update instantly; filters and view switches persist. Include empty week, conflict and fully booked states. Use shared seeded repositories for service profile, job requests, availability, contracts and reputation; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for dispute, secured booking, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use color plus pattern/icon indicators so status is not communicated by color alone. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create CR-04 — Availability Calendar inside the established Crew & Production Services Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

CR-05 Requests & Negotiation Inbox

Pattern: List • Platform: Mobile • Priority: P3

Purpose & scope: Opportunity inbox, offer detail, counteroffer and shared negotiation thread tailored to crew-service terms.

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for service profile, job requests, availability, contracts and reputation; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create CR-05 — Requests & Negotiation Inbox inside the established Crew & Production Services Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

CR-06 Contracts & Payments

Pattern: Money • Platform: Mobile • Priority: P3

Purpose & scope: Crew agreement signing, payment milestones, proof tracking, receipts and issue escalation using shared contract and payment components.

Layout & components: Use money-safe hierarchy: totals and due items first, then milestone/status timeline, then ledger rows and receipts. Amount, currency, payer/payee, due date and verification status must never be visually ambiguous. Confirmation and destructive actions require explicit review modals.

Functional contract: Milestone actions, upload previews, verification outcomes, receipt opening, issue raising and ledger filtering must work. Simulate status transitions but never silently change an amount. Include pending, verified, rejected, partial, refunded and disputed examples. Use shared seeded repositories for service profile, job requests, availability, contracts and reputation; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for contract, payment, append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Amounts use tabular numerals; warning and verification states override decorative accents. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create CR-06 — Contracts & Payments inside the established Crew & Production Services Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

CR-07 Ratings & Work History

Pattern: List • Platform: Mobile • Priority: P3

Purpose & scope: Completed jobs, director reviews, category ratings, repeat-booking score and dispute-free trust indicators.

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for service profile, job requests, availability, contracts and reputation; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for dispute, closed, append a timeline/audit event and refresh connected counters. Notify the responsible admin/partner queue and acknowledge receipt to the reporting party.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create CR-07 — Ratings & Work History inside the established Crew & Production Services Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

16. Casting Director / Agency Portal

Platform: Mobile + Web | Build priority: P3

Portal shell: Web side rail and mobile bottom navigation: Dashboard, Roster, Auditions, Submissions, Records.

Design emphasis: This portal applies the shared cinematic holographic system to roster operations, auditions, candidate submissions and commission. Preserve compact hierarchy, shared status language and the same component geometry used in Admin Dashboard.

Screen count: 8 screens. Screen IDs are stable routing and QA identifiers and must appear in code comments, route definitions or test names.

PORTAL GENERATION PROMPT Build the complete Casting Director / Agency Portal (CA) with 8 screens. Use this shell: Web side rail and mobile bottom navigation: Dashboard, Roster, Auditions, Submissions, Records. Reuse the master design tokens and shared components. Optimize for roster operations, auditions, candidate submissions and commission. Implement every listed route, interaction and seeded state; maintain shared booking, negotiation, contract, payment and trust objects across portals.

CA-01 Agency Dashboard

Pattern: Dashboard • Platform: Mobile + Web • Priority: P3

Purpose & scope: Roster size, active audition requests, submissions pending, bookings via agency, commission earned.

Layout & components: Use a compact command header, one horizontal KPI rail, a primary work canvas, and a narrower action-required rail. On mobile, convert the KPI rail to horizontally scrollable cards and place urgent tasks before analytics. Do not use oversized hero cards; information density and immediate action take priority.

Functional contract: Seed realistic cards, alerts and trends. KPI cards open filtered destinations; task rows can be completed or snoozed; carousels, tabs and quick actions must update local state. Include healthy, urgent and no-activity variants. Use shared seeded repositories for roster operations, auditions, candidate submissions and commission; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for

payment, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Use one restrained holographic focal glow behind the primary workload card; secondary cards remain neutral glass. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create CA-01 — Agency Dashboard inside the established Casting Director / Agency Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

CA-02 Talent Roster Manager

Pattern: List • Platform: Mobile + Web • Priority: P3

Purpose & scope: Add/manage talent (linked accounts or agency-managed profiles), roster categories, availability overview grid across all talent.

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for roster operations, auditions, candidate submissions and commission; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create CA-02 — Talent Roster Manager inside the established Casting Director / Agency Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

CA-03 Audition Request Inbox

Pattern: List • Platform: Mobile + Web • Priority: P3

Purpose & scope: Casting calls from directors targeted at agencies; request detail with role requirements.

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for roster operations, auditions, candidate submissions and commission; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create CA-03 — Audition Request Inbox inside the established Casting Director / Agency Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

CA-04 Candidate Shortlist Builder

Pattern: Form • Platform: Mobile + Web • Priority: P3

Purpose & scope: Select roster talent per request, attach notes, submit shortlist → lands on the director's DP-09 Shortlist Board.

Layout & components: Use a focused stepper or sectioned form with a sticky progress/header region, compact labelled fields, contextual helper text, inline validation, and a live summary or preview panel on wide screens. Mobile uses one column and a sticky bottom action bar. Preserve entered values when navigating backward.

Functional contract: All fields validate, conditional sections appear when triggered, attachments show previews, draft data persists, submit changes the correct demo entity and routes to the next logical screen with a success toast. Include validation-error and partially completed states. Use shared seeded repositories for roster operations, auditions, candidate submissions and commission; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Use luminous focus rings and a subtle progress gradient, not glowing every field. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create CA-04 — Candidate Shortlist Builder inside the established Casting Director / Agency Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

CA-05 Self-Tape Collection

Pattern: Workspace • Platform: Mobile + Web • Priority: P3

Purpose & scope: Request self-tapes from talent, collect uploads, review, forward selected tapes with the shortlist. (Later: AI Audition Organizer transcribes and builds comparison sheets here.)

Layout & components: Use a compact page header, status/context strip, structured content cards, and a clear primary action. Desktop uses a 12-column grid; mobile uses one-column progressive disclosure. Keep the most frequent action within one tap/click.

Functional contract: All tabs, CTAs, menus and linked records must operate on shared seeded data. Every primary action creates visible feedback and routes or mutates state; no placeholder button may remain inert. Use shared seeded repositories for roster operations, auditions, candidate submissions and commission; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for closed, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Apply glass to the shell and command surfaces while keeping data-heavy content on readable near-opaque panels. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create CA-05 — Self-Tape Collection inside the established Casting Director / Agency Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

CA-06 Interview & Selection Notes

Pattern: Workspace • Platform: Mobile + Web • Priority: P3

Purpose & scope: Per-candidate notes, director feedback, selected/rejected states.

Layout & components: Use a compact page header, status/context strip, structured content cards, and a clear primary action. Desktop uses a 12-column grid; mobile uses one-column progressive disclosure. Keep the most frequent action within one tap/click.

Functional contract: All tabs, CTAs, menus and linked records must operate on shared seeded data. Every primary action creates visible feedback and routes or mutates state; no placeholder button may remain inert. Use shared seeded repositories for roster operations, auditions, candidate submissions and commission; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Apply glass to the shell and command surfaces while keeping data-heavy content on readable near-opaque panels. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create CA-06 — Interview & Selection Notes inside the established Casting Director / Agency Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

CA-07 Commission Settings & Records

Pattern: Money • Platform: Mobile + Web • Priority: P3

Purpose & scope: Commission % per booking, auto-calculated splits on verified payments, agency booking records.

Layout & components: Use money-safe hierarchy: totals and due items first, then milestone/status timeline, then ledger rows and receipts. Amount, currency, payer/payee, due date and verification status must never be visually ambiguous. Confirmation and destructive actions require explicit review modals.

Functional contract: Milestone actions, upload previews, verification outcomes, receipt opening, issue raising and ledger filtering must work. Simulate status transitions but never silently change an amount. Include pending, verified, rejected, partial, refunded and disputed examples. Use shared seeded repositories for roster operations, auditions, candidate submissions and commission; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Amounts use tabular numerals; warning and verification states override decorative accents. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create CA-07 — Commission Settings & Records inside the established Casting Director / Agency Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

CA-08 Agency Booking Records

Pattern: List • Platform: Mobile + Web • Priority: P3

Purpose & scope: All bookings closed through the agency: talent, project, value, commission, status.

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for roster operations, auditions, candidate submissions and commission; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create CA-08 — Agency Booking Records inside the established Casting Director / Agency Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

17. Brands / Sponsors Portal

Platform: Web first | Build priority: P4

Portal shell: Compact left navigation: Dashboard, Opportunities, Applications, Campaigns, Payments, Brand Profile.

Design emphasis: This portal applies the shared cinematic holographic system to sponsorship sourcing, applications, campaign approvals and records. Preserve compact hierarchy, shared status language and the same component geometry used in Admin Dashboard.

Screen count: 7 screens. Screen IDs are stable routing and QA identifiers and must appear in code comments, route definitions or test names.

PORTAL GENERATION PROMPT Build the complete Brands / Sponsors Portal (BR) with 7 screens. Use this shell: Compact left navigation: Dashboard, Opportunities, Applications, Campaigns, Payments, Brand Profile. Reuse the master design tokens and shared components. Optimize for sponsorship sourcing, applications, campaign approvals and records. Implement every listed route, interaction and seeded state; maintain shared booking, negotiation, contract, payment and trust objects across portals.

BR-01 Brand Dashboard

Pattern: Dashboard • Platform: Web first • Priority: P4

Purpose & scope: Active sponsorship opportunities, applications, campaigns in progress, approvals due, spend summary and deliverable risks.

Layout & components: Use a compact command header, one horizontal KPI rail, a primary work canvas, and a narrower action-required rail. On mobile, convert the KPI rail to horizontally scrollable cards and place urgent tasks before analytics. Do not use oversized hero cards; information density and immediate action take priority.

Functional contract: Seed realistic cards, alerts and trends. KPI cards open filtered destinations; task rows can be completed or snoozed; carousels, tabs and quick actions must update local state. Include healthy, urgent and no-activity variants. Use shared seeded repositories for sponsorship sourcing, applications, campaign approvals and records; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use one restrained holographic focal glow behind the primary workload card; secondary cards remain neutral glass. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create BR-01 — Brand Dashboard inside the established Brands / Sponsors Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

BR-02 Brand Profile

Pattern: Profile • Platform: Web first • Priority: P4

Purpose & scope: Company KYB, brand category, authorized representatives, billing details, campaign history, brand assets and trust status.

Layout & components: Use a restrained cinematic identity header, trust badges, compact biography/metadata, and tabbed portfolio or operational sections. Media grids should prioritize aspect-ratio consistency, watermarked previews and fast filters. Editing uses a sheet or dedicated form without changing the public-view hierarchy.

Functional contract: Edit, reorder, filter, publish/unpublish and preview actions must work according to role. Media upload creates a local preview and moderation state. Trust/status elements must be driven by seeded data, not hard-coded decoration. Use shared seeded repositories for sponsorship sourcing, applications, campaign approvals and records; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for closed, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Media is the visual focus; UI chrome remains compact, translucent and secondary. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create BR-02 — Brand Profile inside the established Brands / Sponsors Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

BR-03 Opportunity Composer

Pattern: Form • Platform: Web first • Priority: P4

Purpose & scope: Create product-placement, brand-integration, sponsorship and campaign opportunities with budget, usage terms, deliverables and eligibility requirements.

Layout & components: Use a focused stepper or sectioned form with a sticky progress/header region, compact labelled fields, contextual helper text, inline validation, and a live summary or preview panel on wide screens. Mobile uses one column and a sticky bottom action bar. Preserve entered values when navigating backward.

Functional contract: All fields validate, conditional sections appear when triggered, attachments show previews, draft data persists, submit changes the correct demo entity and routes to the next logical screen with a success toast. Include validation-error and partially completed states. Use shared seeded repositories for sponsorship sourcing, applications, campaign approvals and records; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Use luminous focus rings and a subtle progress gradient, not glowing every field. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create BR-03 — Opportunity Composer inside the established Brands / Sponsors Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

BR-04 Applications Inbox

Pattern: List • Platform: Web first • Priority: P4

Purpose & scope: Review producer or talent applications, compare proposals, shortlist, request information and move selected applicants into negotiation.

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for sponsorship sourcing, applications, campaign approvals and records; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, closed, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create BR-04 — Applications Inbox inside the established Brands / Sponsors Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

BR-05 Negotiation & Terms

Pattern: Workspace • Platform: Web first • Priority: P4

Purpose & scope: Shared negotiation component adapted to sponsorship scope, content usage, exclusivity, payment schedule and approval rights.

Layout & components: Use a compact page header, status/context strip, structured content cards, and a clear primary action. Desktop uses a 12-column grid; mobile uses one-column progressive disclosure. Keep the most frequent action within one tap/click.

Functional contract: All tabs, CTAs, menus and linked records must operate on shared seeded data. Every primary action creates visible feedback and routes or mutates state; no placeholder button may remain inert. Use shared seeded repositories for sponsorship sourcing, applications, campaign approvals and records; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, payment, secured booking, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Apply glass to the shell and command surfaces while keeping data-heavy content on readable near-opaque panels. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create BR-05 — Negotiation & Terms inside the established Brands / Sponsors Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

BR-06 Campaign Tracker

Pattern: Workspace • Platform: Web first • Priority: P4

Purpose & scope: Deliverables checklist, proof-of-placement uploads, brand approval flow, due dates, revision requests and completion confirmation.

Layout & components: Use a compact page header, status/context strip, structured content cards, and a clear primary action. Desktop uses a 12-column grid; mobile uses one-column progressive disclosure. Keep the most frequent action within one tap/click.

Functional contract: All tabs, CTAs, menus and linked records must operate on shared seeded data. Every primary action creates visible feedback and routes or mutates state; no placeholder button may remain inert. Use shared seeded repositories for sponsorship sourcing, applications, campaign approvals and records; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Apply glass to the shell and command surfaces while keeping data-heavy content on readable near-opaque panels. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create BR-06 — Campaign Tracker inside the established Brands / Sponsors Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

BR-07 Payments & Records

Pattern: Money • Platform: Web first • Priority: P4

Purpose & scope: Payment milestones, proof verification, campaign ledger, receipts, usage-rights record and exportable campaign files.

Layout & components: Use money-safe hierarchy: totals and due items first, then milestone/status timeline, then ledger rows and receipts. Amount, currency, payer/payee, due date and verification status must never be visually ambiguous. Confirmation and destructive actions require explicit review modals.

Functional contract: Milestone actions, upload previews, verification outcomes, receipt opening, issue raising and ledger filtering must work. Simulate status transitions but never silently change an amount. Include pending, verified, rejected, partial, refunded and disputed examples. Use shared seeded repositories for sponsorship sourcing, applications, campaign approvals and records; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for payment, verification, append a timeline/audit event and refresh connected counters. Notify payer, payee and the admin verification queue as required by the milestone state.

Visual / responsive direction: Amounts use tabular numerals; warning and verification states override decorative accents. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create BR-07 — Payments & Records inside the established Brands / Sponsors Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

18. Legal Partner Portal

Platform: Web | Build priority: P4

Portal shell: Review-focused side rail: Queue, Templates, Addendums, History, Billing.

Design emphasis: This portal applies the shared cinematic holographic system to contract review, controlled annotations, template governance and legal SLA. Preserve compact hierarchy, shared status language and the same component geometry used in Admin Dashboard.

Screen count: 5 screens. Screen IDs are stable routing and QA identifiers and must appear in code comments, route definitions or test names.

PORTAL GENERATION PROMPT Build the complete Legal Partner Portal (LG) with 5 screens. Use this shell: Review-focused side rail: Queue, Templates, Addendums, History, Billing. Reuse the master design tokens and shared components. Optimize for contract review, controlled annotations, template governance and legal SLA. Implement every listed route, interaction and seeded state; maintain shared booking, negotiation, contract, payment and trust objects across portals.

LG-01 Legal Dashboard

Pattern: Dashboard • Platform: Web • Priority: P4

Purpose & scope: Contract-review queue, risk priority, SLA timers, assigned lawyer, requests awaiting client clarification and completed review totals.

Layout & components: Use a compact command header, one horizontal KPI rail, a primary work canvas, and a narrower action-required rail. On mobile, convert the KPI rail to horizontally scrollable cards and place urgent tasks before analytics. Do not use oversized hero cards; information density and immediate action take priority.

Functional contract: Seed realistic cards, alerts and trends. KPI cards open filtered destinations; task rows can be completed or snoozed; carousels, tabs and quick actions must update local state. Include healthy, urgent and no-activity variants. Use shared seeded repositories for contract review, controlled annotations, template governance and legal SLA; preserve IDs,

permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for contract, closed, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Use one restrained holographic focal glow behind the primary workload card; secondary cards remain neutral glass. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create LG-01 — Legal Dashboard inside the established Legal Partner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

LG-02 Contract Review Request Detail

Pattern: Detail • Platform: Web • Priority: P4

Purpose & scope: Rendered contract with clause-by-clause annotation, structured risk flags, comments, approve, request correction and escalation actions.

Layout & components: Use a two-column evidence/workspace layout on desktop: the primary content canvas and a sticky action/summary rail. Mobile collapses into ordered sections with critical actions in a persistent bottom bar. Keep identifiers, status, ownership and timestamps visible at the top.

Functional contract: Actions must mutate the shared demo object, append an audit/timeline event, show confirmation feedback and update upstream lists. Include normal, action-required, read-only, blocked and completed states where relevant. Use shared seeded repositories for contract review, controlled annotations, template governance and legal SLA; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for contract, closed, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Use a fine cinematic divider and a low-opacity status aura behind the record identity block. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create LG-02 — Contract Review Request Detail inside the established Legal Partner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

LG-03 Template Review

Pattern: Form • Platform: Web • Priority: P4

Purpose & scope: Review and propose tracked template changes for admin-managed contract types; changes remain pending until platform approval.

Layout & components: Use a focused stepper or sectioned form with a sticky progress/header region, compact labelled fields, contextual helper text, inline validation, and a live summary or preview panel on wide screens. Mobile uses one column and a sticky bottom action bar. Preserve entered values when navigating backward.

Functional contract: All fields validate, conditional sections appear when triggered, attachments show previews, draft data persists, submit changes the correct demo entity and routes to the next logical screen with a success toast. Include validation-error and partially completed states. Use shared seeded repositories for contract review, controlled annotations, template governance and legal SLA; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for contract, closed, append a timeline/audit event and refresh connected counters. Notify unsigned parties, project owner and the contract center; append an immutable timeline event.

Visual / responsive direction: Use luminous focus rings and a subtle progress gradient, not glowing every field. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create LG-03 — Template Review inside the established Legal Partner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

LG-04 Addendum Review

Pattern: Workspace • Platform: Web • Priority: P4

Purpose & scope: Review addendums generated from pinned negotiation or project-room decisions before signature.

Layout & components: Use a compact page header, status/context strip, structured content cards, and a clear primary action. Desktop uses a 12-column grid; mobile uses one-column progressive disclosure. Keep the most frequent action within one tap/click.

Functional contract: All tabs, CTAs, menus and linked records must operate on shared seeded data. Every primary action creates visible feedback and routes or mutates state; no placeholder button may remain inert. Use shared seeded repositories for contract review, controlled annotations, template governance and legal SLA; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for negotiat, contract, closed, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Apply glass to the shell and command surfaces while keeping data-heavy content on readable near-opaque panels. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create LG-04 — Addendum Review inside the established Legal Partner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

LG-05 Review History & Billing

Pattern: List • Platform: Web • Priority: P4

Purpose & scope: Completed reviews, turnaround metrics, legal notes, invoices and premium review workflow records.

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for contract review, controlled annotations, template governance and legal SLA; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for closed, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create LG-05 — Review History & Billing inside the established Legal Partner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

19. Insurance / Safety Partner Portal

Platform: Web | Build priority: P4

Portal shell: Operational side rail: Dashboard, Policies, Claims, Safety Checks, Incidents.

Design emphasis: This portal applies the shared cinematic holographic system to policy support, shoot safety, claims and incident evidence. Preserve compact hierarchy, shared status language and the same component geometry used in Admin Dashboard.

Screen count: 5 screens. Screen IDs are stable routing and QA identifiers and must appear in code comments, route definitions or test names.

PORTAL GENERATION PROMPT Build the complete Insurance / Safety Partner Portal (IN) with 5 screens. Use this shell: Operational side rail: Dashboard, Policies, Claims, Safety Checks, Incidents. Reuse the master design tokens and shared components. Optimize for policy support, shoot safety, claims and incident evidence. Implement every listed route, interaction and seeded state; maintain shared booking, negotiation, contract, payment and trust objects across portals.

IN-01 Insurance / Safety Dashboard

Pattern: Dashboard • Platform: Web • Priority: P4

Purpose & scope: Active policies, open claims, upcoming insured shoots, incidents, safety checks due and high-risk bookings.

Layout & components: Use a compact command header, one horizontal KPI rail, a primary work canvas, and a narrower action-required rail. On mobile, convert the KPI rail to horizontally scrollable cards and place urgent tasks before analytics. Do not use oversized hero cards; information density and immediate action take priority.

Functional contract: Seed realistic cards, alerts and trends. KPI cards open filtered destinations; task rows can be completed or snoozed; carousels, tabs and quick actions must update local state. Include healthy, urgent and no-activity variants. Use shared seeded repositories for policy support, shoot safety, claims and incident evidence; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for dispute, append a timeline/audit event and refresh connected counters. Notify the responsible admin/partner queue and acknowledge receipt to the reporting party.

Visual / responsive direction: Use one restrained holographic focal glow behind the primary workload card; secondary cards remain neutral glass. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create IN-01 — Insurance / Safety Dashboard inside the established Insurance / Safety Partner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

IN-02 Shoot Insurance Records

Pattern: List • Platform: Web • Priority: P4

Purpose & scope: Policy records attached to projects and bookings, coverage summary, insured parties, validity dates and policy documents.

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for policy support, shoot safety, claims and incident evidence; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create IN-02 — Shoot Insurance Records inside the established Insurance / Safety Partner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

IN-03 Claim Support

Pattern: Inspection • Platform: Web • Priority: P4

Purpose & scope: Damage claims escalated from location or equipment flows with preassembled evidence, policy checks, adjuster notes and decision status.

Layout & components: Use a guided operational checklist with progress, required evidence capture, serial/room identifiers, before/after comparison, signatures and a final review step. Prevent completion when mandatory evidence is missing. Support draft saving and clear offline-safe states.

Functional contract: Checklist completion, image placeholders/previews, notes, confirmations, comparison and claim creation must work. Evidence remains attached to the correct booking/item/property and appears in the dispute demo data. Use shared seeded repositories for policy support, shoot safety, claims and incident evidence; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for dispute, append a timeline/audit event and refresh connected counters. Notify the responsible admin/partner queue and acknowledge receipt to the reporting party.

Visual / responsive direction: Prioritize evidence clarity over decoration; use holographic treatment only on progress and confirmed matches. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create IN-03 — Claim Support inside the established Insurance / Safety Partner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

IN-04 Safety Checks & Permits

Pattern: Inspection • Platform: Web • Priority: P4

Purpose & scope: Shoot safety checklist, permit document support, risk documentation, responsible persons, due dates and completion evidence.

Layout & components: Use a guided operational checklist with progress, required evidence capture, serial/room identifiers, before/after comparison, signatures and a final review step. Prevent completion when mandatory evidence is missing. Support draft saving and clear offline-safe states.

Functional contract: Checklist completion, image placeholders/previews, notes, confirmations, comparison and claim creation must work. Evidence remains attached to the correct booking/item/property and appears in the dispute demo data. Use shared seeded repositories for policy support, shoot safety, claims and incident evidence; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Prioritize evidence clarity over decoration; use holographic treatment only on progress and confirmed matches. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create IN-04 — Safety Checks & Permits inside the established Insurance / Safety Partner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

IN-05 Incident Reports

Pattern: Analytics • Platform: Web • Priority: P4

Purpose & scope: Incident intake, severity classification, involved parties, evidence, escalation record, corrective action and resolution notes.

Layout & components: Use compact summary metrics, a filter/date bar, one primary chart at a time, supporting small charts, and a detailed table that explains the numbers. Charts must have legends, tooltips and accessible textual summaries. Exports and drill-downs must work in demo mode.

Functional contract: Date/category filters recompute seeded metrics, tooltips display values, table rows drill into source entities and export creates a local downloadable demo artifact or confirmation. Include insufficient-data and filtered-empty states. Use shared seeded repositories for policy support, shoot safety, claims and incident evidence; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for dispute, append a timeline/audit event and refresh connected counters. Notify the responsible admin/partner queue and acknowledge receipt to the reporting party.

Visual / responsive direction: Charts use tokenized gold, cyan and violet accents on quiet surfaces; never use rainbow palettes. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create IN-05 — Incident Reports inside the established Insurance / Safety Partner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

20. Distribution / Release Partner Portal

Platform: Web | **Build priority:** P4

Portal shell: Minimal side rail: Dashboard, Contacts, Release Coordination, Reporting.

Design emphasis: This portal applies the shared cinematic holographic system to release handover, partner coordination and post-release reporting. Preserve compact hierarchy, shared status language and the same component geometry used in Admin Dashboard.

Screen count: 4 screens. Screen IDs are stable routing and QA identifiers and must appear in code comments, route definitions or test names.

PORTAL GENERATION PROMPT Build the complete Distribution / Release Partner Portal (DS) with 4 screens. Use this shell: Minimal side rail: Dashboard, Contacts, Release Coordination, Reporting. Reuse the master design tokens and shared components. Optimize for release handover, partner coordination and post-release reporting. Implement every listed route, interaction and seeded state; maintain shared booking, negotiation, contract, payment and trust objects across portals.

DS-01 Distribution Dashboard

Pattern: Dashboard • Platform: Web • Priority: P4

Purpose & scope: Projects nearing completion, release coordination requests, missing handover items, planned release windows and active partner tasks.

Layout & components: Use a compact command header, one horizontal KPI rail, a primary work canvas, and a narrower action-required rail. On mobile, convert the KPI rail to horizontally scrollable cards and place urgent tasks before analytics. Do not use oversized hero cards; information density and immediate action take priority.

Functional contract: Seed realistic cards, alerts and trends. KPI cards open filtered destinations; task rows can be completed or snoozed; carousels, tabs and quick actions must update local state. Include healthy, urgent and no-activity variants. Use shared seeded repositories for release handover, partner coordination and post-release reporting; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for secured booking, append a timeline/audit event and refresh connected counters. Notify the counterparty and update both action centers from the same shared object.

Visual / responsive direction: Use one restrained holographic focal glow behind the primary workload card; secondary cards remain neutral glass. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create DS-01 — Distribution Dashboard inside the established Distribution / Release Partner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

DS-02 Distributor Contacts & Records

Pattern: List • Platform: Web • Priority: P4

Purpose & scope: Cinema, television, OTT and distribution partner records with territories, notes, contact roles and previous project relationships.

Layout & components: Use a filter/search command bar followed by a dense table on web and stacked information cards on mobile. Provide saved filters, sort, status chips, selection where relevant, and a right-side detail drawer so users do not lose list context. Empty, loading, error and filtered-zero states are mandatory.

Functional contract: Search, sort, filters, tabs, pagination or virtual scrolling, row actions, selection and detail drawers must operate on seeded repositories. Changing an item updates badges and counts everywhere that item appears. Use shared seeded repositories for release handover, partner coordination and post-release reporting; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for the role-specific entity lifecycle, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Keep rows matte and readable; reserve holographic accents for selected rows, risk flags and active filters. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create DS-02 — Distributor Contacts & Records inside the established Distribution / Release Partner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

DS-03 Release Coordination

Pattern: Workspace • Platform: Web • Priority: P4

Purpose & scope: Project handover checklist, master files, metadata, campaign visibility records, approvals, deadlines and release status.

Layout & components: Use a compact page header, status/context strip, structured content cards, and a clear primary action. Desktop uses a 12-column grid; mobile uses one-column progressive disclosure. Keep the most frequent action within one tap/click.

Functional contract: All tabs, CTAs, menus and linked records must operate on shared seeded data. Every primary action creates visible feedback and routes or mutates state; no placeholder button may remain inert. Use shared seeded repositories for release handover, partner coordination and post-release reporting; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for secured booking, append a timeline/audit event and refresh connected counters. Use deep-linked notifications only for meaningful action-required or status-change events; avoid noisy cosmetic alerts.

Visual / responsive direction: Apply glass to the shell and command surfaces while keeping data-heavy content on readable near-opaque panels. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create DS-03 — Release Coordination inside the established Distribution / Release Partner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

DS-04 Performance Reporting

Pattern: Analytics • Platform: Web • Priority: P4

Purpose & scope: Post-release reporting support for territories, channels, audience metrics, revenue statements and partner-submitted reports.

Layout & components: Use compact summary metrics, a filter/date bar, one primary chart at a time, supporting small charts, and a detailed table that explains the numbers. Charts must have legends, tooltips and accessible textual summaries. Exports and drill-downs must work in demo mode.

Functional contract: Date/category filters recompute seeded metrics, tooltips display values, table rows drill into source entities and export creates a local downloadable demo artifact or confirmation. Include insufficient-data and filtered-empty states. Use shared seeded repositories for release handover, partner coordination and post-release reporting; preserve IDs, permissions, ownership, dates and linked status everywhere. Role-valid actions must update the shared state machine for dispute, closed, append a timeline/audit event and refresh connected counters. Notify the responsible admin/partner queue and acknowledge receipt to the reporting party.

Visual / responsive direction: Charts use tokenized gold, cyan and violet accents on quiet surfaces; never use rainbow palettes. Apply the portal shell rules and preserve compact hierarchy on mobile, tablet and web.

AI SCREEN PROMPT — Create DS-04 — Performance Reporting inside the established Distribution / Release Partner Portal shell. Follow the master prompt and existing Admin Dashboard tokens. Implement the stated layout, interactions, shared-state updates, responsive light/dark UI and all loading, empty, error, validation and success states. No dead controls or duplicate data.

21. End-to-End Demo Scenarios & Final QA

Purpose: These scenarios prove that the static build is an integrated application rather than disconnected screens. Each scenario should be usable in a live presentation and automated as an integration/UI test.

Scenario A — Director books an actor

- Login as Director → open project → create role requirement → discover/filter talent → view profile → shortlist → send structured offer.
- Switch to Actor role/account → open opportunity → counter fee and travel condition → Director sees the same new round → both accept.
- Generate contract → sign from both sides → upload deposit proof → Admin verifies → booking becomes secured and both calendars update.
- Open project room → mark shoot in progress → confirm completion → complete final payment → actor confirms receipt → close → both submit ratings.

Scenario B — Location deposit and damage claim

- Director books a location through negotiation and contract; admin verifies deposit and rental payment.
- Owner performs check-in with required room photos and meter readings; both parties confirm handover.
- At check-out, compare evidence, flag damage, enter amount and submit claim; Admin evidence room automatically shows contract, chat, payment and before/after images.
- Admin resolves claim and ledger/deposit state updates for both parties.

Scenario C — Equipment handover and return

- Provider packages exact inventory with serials; Director books the package.
- Handover confirms each item, accessory and condition; secured booking moves into progress.
- Return flow flags a missing accessory; claim and deposit adjustment travel through dispute engine.
- Provider utilization, earnings and rating screens update after closure.

Scenario D — Agency submission and commission

- Director sends casting request to agency; agency selects roster talent and submits a shortlist into the Director shortlist board.
- One candidate is booked through the shared flow.
- Verified payment automatically creates the agency commission record and linked booking history.

Scenario E — Brand campaign and partner review

- Brand posts sponsorship opportunity; producer applies; parties negotiate deliverables and usage terms.
- Legal partner reviews a generated contract/addendum; campaign tracker collects proof and approvals.
- Payment and usage-rights records remain attached to the campaign through closure.

Final visual QA gate

- Compare every portal against the existing Admin Dashboard at the same viewport: typography, radii, glass, padding, icon weight, top-bar geometry and light/dark behavior must feel native.
- Inspect at 360×800, 390×844, 768×1024, 1280×800, 1440×900 and 1920×1080. Fix wrapping, clipping and excessively stretched layouts.
- Run the five demo scenarios after a reset. No action may require manual data editing.
- Check all routes from notifications, table rows, cards, dashboards and breadcrumbs.
- Check keyboard navigation, focus visibility, reduced motion, screen-reader labels and text scaling.
- Check every money and contract action for confirmation, immutable timeline output and clear counterparty identity.
- Check all empty/loading/error/permission/offline states in both themes.
- Only after these checks should production API integration begin.

Definition of complete

The UI build is complete when: All 131 screens exist; every portal uses the shared theme and shell system; the core booking journey works end-to-end with local data; role and theme switching persist; all screens are responsive and accessible; every action has behavior; and the application can be demonstrated without explaining away missing interactions.

Appendix — Route / Screen ID Inventory

Shared Core Layer

SC-01 Splash Screen	SC-02 Onboarding Carousel (3–4 slides)
SC-03 Role Selection Screen	SC-04 Login Screen
SC-05 Sign Up Screen (+ OTP Verification sub-screen)	SC-06 Forgot Password / Reset Screen
SC-07 KYC / Verification Upload Screen	SC-08 Verification Pending / Rejected Screen
SC-09 Profile / Role Switcher	SC-10 Notification Center
SC-11 Booking-Level Chat Screen	SC-12 Contract Viewer & E-Signing Screen
SC-13 Payment Proof Upload Screen	SC-14 Receipts & Ledger Screen (per user)
SC-15 Ratings & Review Screen	SC-16 Report & Block Screen
SC-17 Settings & Account Screen	

System & Utility States

UT-01 Error & Retry Screen	UT-02 Empty-State Templates
UT-03 No-Internet Screen	UT-04 Force-Update Screen
UT-05 Maintenance-Mode Screen	

Super Admin / Company Control Portal

SA-01 Admin Dashboard (Home)	SA-02 User Verification Queue
SA-03 KYC / KYB Review Detail	SA-04 Profile & Content Moderation Queue
SA-05 Listings Moderation (Locations, Equipment, Packages)	SA-06 Booking & Negotiation Monitor
SA-07 Payment Verification Queue (the money screen)	SA-08 Payment Review Detail
SA-09 Contract Template Manager	SA-10 Commission & Fee Management
SA-11 Dispute Center (List)	SA-12 Dispute Case File (single-screen evidence room)

SA-13 User Management (All Users)	SA-14 Admin Roles & Permissions
SA-15 Support CRM / Tickets	SA-16 Broadcast & Announcements
SA-17 Audit Log Explorer	SA-18 Analytics Dashboard

Director / Producer Portal

DP-01 Home Dashboard	DP-02 Projects List
DP-03 Create Project Wizard	DP-04 Project Detail (Hub Screen)
DP-05 Requirement Builder	DP-06 Marketplace Discovery / Search
DP-07 Smart Filters Sheet	DP-08 Stakeholder Profile Detail (viewing others)
DP-09 Shortlist Board	DP-10 Booking Request Form (spine entry point)
DP-11 Bargaining Center (List)	DP-12 Negotiation Thread Detail (shared component with all stakeholder portals)
DP-13 Contract Center (per project)	DP-14 Payment Center (per project)
DP-15 Calendar & Schedule	DP-16 Project Accounts / Budget
DP-17 Project Room (Group Collaboration)	DP-18 Reports & Export

Actor / Talent Portal

AT-01 Talent Dashboard	AT-02 Profile Builder
AT-03 Portfolio & Showreel Manager	AT-04 Availability Calendar (own)
AT-05 Rate Card	AT-06 Opportunity Inbox
AT-07 Offer Detail & Response	AT-08 Counteroffer Composer
AT-09 Contract Signing (uses SC-12)	AT-10 Earnings & Payment Security
AT-11 Reputation & Reviews	AT-12 Safety Controls

Model Extension

MD-01 Campaign Categories Setup	MD-02 Usage Rights Manager (the model-industry differentiator)
MD-03 Portfolio Categories	MD-04 Rate by Usage
MD-05 Brand Safety Preferences	

Location Owner Portal

LO-01 Owner Dashboard	LO-02 Location Listing Wizard
LO-03 Availability Calendar	LO-04 Pricing & Deposit Setup
LO-05 Rules & Restrictions	LO-06 Booking Requests Inbox
LO-07 Check-In Inspection Screen	LO-08 Check-Out & Damage Claim Screen
LO-09 Earnings & Deposits	LO-10 Property Performance

Media / Equipment Provider Portal

ME-01 Provider Dashboard	ME-02 Provider Profile
ME-03 Inventory Manager	ME-04 Package Builder
ME-05 Availability Calendar	ME-06 Rate & Terms Management
ME-07 Booking Requests & Negotiation	ME-08 Handover Checklist
ME-09 Return Checklist	ME-10 Earnings & Ratings

Crew & Production Services Portal

CR-01 Crew Dashboard	CR-02 Service Profile
CR-03 Portfolio & Credits	CR-04 Availability Calendar
CR-05 Requests & Negotiation Inbox	CR-06 Contracts & Payments

CR-07 Ratings & Work History

Casting Director / Agency Portal

CA-01 Agency Dashboard	CA-02 Talent Roster Manager
CA-03 Audition Request Inbox	CA-04 Candidate Shortlist Builder
CA-05 Self-Tape Collection	CA-06 Interview & Selection Notes
CA-07 Commission Settings & Records	CA-08 Agency Booking Records

Brands / Sponsors Portal

BR-01 Brand Dashboard	BR-02 Brand Profile
BR-03 Opportunity Composer	BR-04 Applications Inbox
BR-05 Negotiation & Terms	BR-06 Campaign Tracker
BR-07 Payments & Records	

Legal Partner Portal

LG-01 Legal Dashboard	LG-02 Contract Review Request Detail
LG-03 Template Review	LG-04 Addendum Review
LG-05 Review History & Billing	

Insurance / Safety Partner Portal

IN-01 Insurance / Safety Dashboard	IN-02 Shoot Insurance Records
IN-03 Claim Support	IN-04 Safety Checks & Permits
IN-05 Incident Reports	

Distribution / Release Partner Portal

DS-01 Distribution Dashboard	DS-02 Distributor Contacts & Records
DS-03 Release Coordination	DS-04 Performance Reporting
